9. Develop new land use numbers for spread sheet and for Table B. 11. 0. 3.

A. Ex Situ Intermediate Separations

1. Retrieval annexe no change. 3 ha
2. Vit plant - change in HLW storage pads and change in number of vaults.

Change in storage pad area for HLW = (8350 - 3030)
= (5320)(6.6) = 35112 m^2
= 3.5 hectares decrease

Change in vault area = (83 - 66) (555) = 9435
(17) (555) = 1 hectare decrease

Vit Plant 88 - 3.5 = 84.5 ha.

temporary commitment = 84.5 + 3 = 87.5 ha.

Long term permanent commitment = 37 - 1 = 36 ha.
Closure = 12 - 1 = 11 ha.

Permanent total = 47 = 36 + 11 = 47 ha

temporary total = 87.5 + 24 = 111.5 ha

B. Ex Situ No Separations Calcination

Change occurs in storage pad requirement.
Previously 27097 HMPCs & Shield casks.
now 10,300 HMPCs and Shield Casks.
Decrease in area = 29097 - 10,300 = 16 797
= (16 797)(6.6) = 110, 860 m^2
= 11 hectare decrease
temporary commitment = 81 - 11 = 70 ha
total = 20 + 70 = 90 ha.

C. Ex Situ No Separations Vitrification calculation - Supports 41 and 42 of this calculation.

9.D. Ex Situ Extensive Separations alternative.
Changes occur in vault construction and in HLW storage pad size.
Temporary commitment for HLW pad.
decrease = (old − new cells) (6.6)
= (393 − 143) = (250)(6.6) = 1604 m²
Change is negligible.

vaults = (82 − 66) = (16) (555) = 8,880 m² ≃ 1 hectare

Construction/operation permanent commitment = 34 − 1 = 33 ha

Closure = tank farm + vaults = 8 ha + (?)
= 8 + (6.6)(555) = 8 + 3.7 ha. ≃ 12 ha
= no change.

E. Ex Situ / In Situ Combination
vault change (42 − 40) = 2
number of shield cells (4175 − 1500)
= 2675

area for vault change = (2)(555) = 1110 m²
negligible change in this item.

area for storage pad change = (2675)(6.6) = 17655 m²
= 1.8 ha decrease
≃ 2 ha
Temporary commitment of land = 87 − 2 = 85 ha.
total = 85 + 22 = 107 ha.

F. Phased Implementation - phase I no change.

G. Ex Situ / In Situ Combination Low

Permanent commitment = (31) (10,000) − (42)(555)
= (286690)(0.7) = 200683
= 200683 + (24)(555)
= 214003 ≃ 21.5 ha.

9. b. vaults = (24)(555) = 13320 = 1.3 ha.
Closure = 8 + 1.3 = 9.3 ha

total = 9.3 + 21.5 = 30.8 ha.

temporary change commitment (87)(10000) − (6.6)(9175)
= 870000 − 27555
= 842445 (0.7)
= 589711.5

new area = 589711.5 + 9200 = 599611.5 m²
= 60 ha.

total = 60 + 22 = 82 ha

9. Phased Implementation - Phase II.

permanent commitment of land cost/operation

Intermediate separations = 36 ha

= 360,000 m² − vault area (36630) and − annexes
= (360,000) − (36630) − (30,000)
= 293370 − fraction for HLW = (0.056565) = 16595
= 276775 (0.7) 16595 (0.7)
= 193742.5 (2) 11617
= 387485
= (387485) + (11617) + (36630) + (30,000)
Σ = 465732
= 47 ha.

Closure commitment assumed same.

total = 59 hectares

temporary land commitment Construction and operations

Intermediate separations = 87.5 annexes = 3.0
87.5 − 3 = 84.5

9. H.

84.5 (0.06) = 5
79.5 (0.7) 5
55.65 (2) 3.5
111.3
Σ 111.3 + 3.5 + 3 = 118

Closure remained the same @ 24 ha
Σ = 118 + 24 = 142

10. Calculate the Borrow Site silt (m^3) for the Ex Situ alternatives

A. Ex Situ no Separations with
Barrier silt = 8 hectares 2 meters thick
= 3.77E+05 m^3

(8 ha) = 80,000 meters^2 1 meter depth
= 80,000 m^3 @ 1.46 gm/cm^3 = mg/m^3
= 116800 mg (0.15)
= 17520 mg pea gravel @ 2 mg/m^3
= 8760 m^3 pea gravel.

Number of trips = (~~80,000~~ 3.77E+05)(1.31) + (8760)(1.3)
= ~~116275.6~~ 493870
@16 yds^3 = ~~7267.23~~ 30866.88 trips. = 6550 + 717.23
30866.88

B. Ex Situ No Separations Calcination

Barrier Silt = 3.77E+05 m^3 pea gravel = 8760 m^3
@16 yds^3 = ~~6550~~ 30866.88 trips + 717.23 trips.

C. Ex Situ Extension Separations
Barrier silt = (12)(10,000) = 120,000 @ 1m thick
= 120,000 m^3
+1 more meter = 240,000 m^3 @1.46 gm = 175200 @15% = 26280 mg
= (240000)(1.31) @ 2 gm/cm = 13140 m^3 pea gravel.
= 314400 @1.31 = 17213.4
@16 yds^3 = 19650 trips @ 16 yds^3 = 1076 trips

JACOBS ENGINEERING GROUP INC.

DATE 6-30-96 SUBJECT Resource Summary table B.11.0.3 and transportation tables SHEET NO. 215 of 393

BY RDW CHKD. _____ JOB NO. 01K 47101

table II Calculation Results for the TWRS FEIS draft to the latest criteria for canisters etc in handling the final vitrified glass product.

Numbers are broken down to put everything on the same basis for transportation and to establish common points of origin for transportation.

Items were added that had not previously been considered in the resource table for the spread sheets

Pages 216 through 246

10300	246363
29100	623233

Revised numbers for Combination 1 & 2 generated 7-5 & 7-6, 1996

RDW

$(370\ m^3)(0.4) \simeq 150\ m^3$

$\times 264 \simeq 39600$ gallons

$\div 5000 = 8$ trips

FORM 91-005-1 (4/81)

Table III

Table is a tabulation of the number of trips required by vehicle chosen in the calculation that supports the tabulated results.

This information is used to generate Table IV.

Pages 248 through 259

Table ~~XX~~ IV

Transportation Summary for the Resources transported to support the various phases of the numerous alternatives.

Transportation data input for the analyses performed and the results presented in Appendix E.

Pages 261 through 295

all Rail traffic originates in Portland/Seattle to form the estimated 28 car trains or portions thereof. all rail traffic also assumed to terminate at a point in 200 West area.

Page 261 is a tabulation of the number of trains and trucks estimated for each alternative

The HLW trains are only 10 car trains or portions thereof for shipment of the HLW waste to the repository. (assumed to be Yucca Mountain, Nevada).

18. Determine the values for Table 5.16.1.
The values used herein are obtained from Table II of this calculation. The following definition of activity divisions apply:
1. Construction and filling of tanks with sand or gravel is considered remediation for the In Situ operations
2. For the Ex Situ operations the tank filling with gravel is a function of the closure operation.
3. With the combination processes filling the empty tanks is a part of closure whereas filling the liquid tanks not retrieved is an operation function.

A. Determine the commitment of sand, gravel, silt, and rip rap (Basalt) Resources for the alternatives.
1. No action
None are applicable

2. Long-Term Management
a. Remediation
(1) Sand and gravel = 3.8 E+05 m^3

b. Total =
(1) Sand and gravel = 3.8 E+05 m^3

3. In Situ Fill and Cap
a. Remediation
(1) Fill tanks with sand/gravel = 7.54 E+05 m^3

b. Total
(1) Fill tanks = 7.54 E+05 m^3 sand/gravel
(2) Tank stab and must, pass equip = 2.03 E+04 m^3 sand/gravel
(3) Barrier = 4.24 E+05 m^3 sand/gravel
(4) Silt = 3.77 E+05 m^3
(5) Rip Rap (Basalt) = 6.38 E+05 m^3

Σ = 2.21 E+06 m^3

8. A. ~~4.~~ In Situ Vitrification

a. Remediation

(1) Construction sand and gravel 1.39 E+05 m^3
(2) fill tanks with sand 5.4 E+05 m^3

Σ = 6.79 E+05 m^3

b. Total

(1) Construction sand and gravel 1.39 E+05 m^3
(2) fill tank w ith sand 5.4 E+05 m^3
(3) Barrier sand and gravel 4.24 E+05 m^3
(4) ~~Barrier~~ silt 3.77 E+05 m^3
(5) Barrier rip rap (basalt) 6.38 E+05 m^3

Σ = 2.12 E+06 m^3

5. Intermediate Separations

a. Remediation

(1) Construction sand and gravel 1.148 E+06 m^3
(2) operations sand and gravel 5.1 E+05 m^3

Σ = 1.66 E+06 m^3

b. Total

(1) Construction sand and gravel 1.148 E+06 m^3
(2) operation sand and gravel 5.1 E+05 m^3
(3) Musts, tank slab, misc equip. sand and gravel 2.03 E+04 m^3
(4) Tank fill gravel 7.58 E+05 m^3
(5) Barrier sand and gravel 5.8 E+05 m^3
(6) Barrier silt 5.19 E+05 m^3
(7) Barrier riprap (basalt) 8.78 E+05 m^3

Σ = 3.88 E+06 m^3

6. Ex Situ No Separation Vitrification

a. Remediation

(1) Construction sand and gravel 2.97 E+05
(2) operation sand and gravel 2.65 E+06

Σ = 2.95 E+06

B. Steel in metric tons column was total carbon steel from Table II.

18. C. Column for Stainless Steel and alloy Steel (Hastelloy) was added. The data again was a summation from the data in Table II above.

D. Column for Concrete was entered from the data from Table II above. The quantities here consisted of a summation of: (1) operation; (2) Construction; and (3) Closure where applicable.

E. Total water usage as entered in this column was obtained from table II above.

F. The column for Electric Power was entered from data obtained from Table II above.

G. The Gasoline column data was obtained from table II above.

H. The Diesel column data was obtained from Table II above.

I. The Kerosene Column data was added and was transferred from table II above.

J. The Process chemicals column was added. The data was taken from Table II above and is a summation of the following: (1) process chemicals, (2) Glass formers, and (3) Sulfur cement materials.

K. The Cost column was taken from the analysis data contained in another calculation.

19. Determine the data for Table B.6.2.1. Data is taken from Table II above and from the break down used to generate a part of Table 5.16.1 above in item 18.

a. Long-term management

1. Sand and gravel = 3.8E+05 m^3 = 1.344 E+07 ft^3

cubic ft = ft^3 = (m^3)(1.31)(27) = (M^3)(35.37)

19. B. In Situ Fill and Cap
sand and aggregate = 7.54E+05 m^3 = 2.67 E+07 ft^3

C. In Situ vitrification &
Sand and aggregate = 6.79E+05 m^3 = 2.4 E+07 ft^3

D. Ex Situ Intermediate Separations
aggregate and Sand = 1.66 E+06 m^3 = 5.87 E+07 ft^3

E. Ex Situ No-Separation vitrification
aggregate and Sand = 2.95E +06 m^3 = 1.04E+08 ft^3

F. Ex Situ No Separations Calcination
aggregate and Sand = 1.332E+06 m^3 = 4.71E+07 ft^3

G. Ex Situ Extension Separations
aggregate and Sand = 9.5E+05 m^3 = 3.36 E+07 ft^3

H. Ex Situ / In Situ Combination 1
aggregate and Sand = 9.47E+05 m^3 = 3.35E+07 ft^3

I. Ex Situ / In Situ Combination 2
aggregate and Sand = 1.01E+06 m^3 = 3.57 E+07 ft^3

J. Phased Implementation Phase I
aggregate and Sand = 3.2E+04 m^3 = 1.13E+06 ft^3

K. Phased Implementation Phase II
aggregate and Sand = 1.2 E+06 m^3 = 4.24 E+07 ft^3

20. Determine the data for table B.6.2.2 Data is taken from Table II above and from the break-down used to generate a part of Table 5.16.1 above in item 18.

A. Ex Situ all aggregate = 7.58E+05 m^3 = 2.70E+07 ft^3

B. Ex Situ / In Situ Combination 1
aggregate = 3.30E+05 m^3 = 1.62E+07 ft^3

20. C. Ex Situ/In Situ Combination 2
aggregate = 1.18E+05 m^3 = 4.17E+06 ft^3

D. Phased Implementation - Phase II
aggregate = 7.58E+05 m^3 = 2.70E+07 ft^3

21. Determine the data for Table B-6-2.3. Data is taken from Table II above and from the breakdown used to generate a part of table 5-16-1 above in item 18.

A. In Situ Fill and Cap, In Situ vitrification or Ex Situ No Separations (vitrification or Calcination).
Silt = 3.77E+05 m^3 = 1.30E+07 ft^3
Riprap = 6.38E+05 m^3 = 2.30E+07 ft^3
aggregate and Sand = 4.24E+05 m^3 = 1.50E+07 ft^3
The increase from 4.15 to 4.24 includes the pea gravel needed to mix with one layer of silt in the Barrier Construction.

B. Ex Situ Intermediate Separations, Ex Situ Extensive Separations, or phased Implementation phase 2
Silt = 5.66E+05 m^3 = 2.0E+07 ft^3
Riprap = 9.85E+05 m^3 = 3.48E+07 ft^3
aggregate and Sand = 5.81E+05 m^3 = 2.06E+07 ft^3

C. Ex Situ/In Situ Combination 1
Silt = 4.72E+05 m^3 = 1.67E+07 ft^3
Riprap = 7.85E+05 m^3 = 2.8E+07 ft^3
aggregate and Sand = 5.16E+05 m^3 = 1.83E+07 ft^3

D. added a footnote to Table B.6.2.1
NOTE: 1. Includes material to fill tanks not emptied of radioactive waste.
applies to items 1. In Situ Fill and Cap
2. In Situ Vitrification
3. Ex Situ/In Situ Combination 1
4. Ex Situ/In Situ Combination 2.

21. E. Ex Situ / In Situ Combination 2

Silt = 4.25E+05 m^3 = 1.50E+07 ft^3 = McGee Ranch
RipRap = 7.18E+05 m^3 = 2.54E+07 ft^3 = Vernita Quarry
Aggregate and Sand = 4.82E+05 m^3 = 1.71E+07 ft^3 = Pit 30

22. Develop Numbers for Table 3.6.1

These numbers are identical with the numbers in Table B.6.2.1. See item 19 above.

23. Develop numbers for Table 3.6.2

These numbers are identical with the numbers in Table B.6.2.2. See item 20 above.

24. Develop numbers for Table 3.6.3

These numbers are identical with the numbers in Table B.6.2.3. See item 21 above

26. Determine the data for Table 5.1.1. Two alternatives are to be added to this tabulation of data.

A. No action Tank Waste alternative

1. Remediation
   a. Sand and gravel = NR
   b. Silt = NR
   c. Rip Rap = NR
   d. Soil Disturbance
      (1) temporary = 0
      (2) Permanent = 0

2. total alternative (includes remediation and closure as landfill)
   a. Sand and gravel = NR
   b. Silt = NR
   c. Rip Rap = NR

25. A. 2. d. Soil Disturbance

Page 179 of this Calculation (1) Tank Farm Barren = 17.4495 ha
(2) Tank Farm = 11.8131 ha

(1) Temporary = 0
(2) Permanent = 17.449 ha = 43.12 acres

B. Long-Term management Tank Waste alternative

1. Remediation
a. Sand and gravel = 3.8E+05 m^3 = 5.0E+05 yd^3
b. Silt = NR
c. Rip Rap = NR
d. Soil Disturbance
(1) Temporary = To be determined by another calculation
(2) Permanent = To be determined by another calculation

2. Total alternative (Includes remediation and closure as land fill).
a. Sand and gravel = 3.8E+05 m^3 = 5.0E+05 yd^3
b. Silt = NR
c. RipRap = NR
d. Soil Disturbance
(1) Temporary = To be determined by another calculation
(2) permanent = To be determined by another calculation

C. In Situ Fill and Cap Tank Waste alternative

1. Remediation
a. Sand and gravel = 7.54E+05 m^3 = 9.88E+05 yd^3
b. Silt = NR
c. Riprap = NR
d. Soil disturbance
(1) Temporary = To be determined by another calculation
(2) Permanent = To be determined by another calculation

2. Total alternative (Includes remediation and closure as landfill).
a. Sand and gravel = 11.98E+05 = 1.2E+06 m^3 = 1.57E+06 yd^3
b. Silt = 3.77E+05 = 3.80E+05 m^3 = 5.0E+05 yd^3
c. Rip Rap = 6.38E+05 = 6.4E+05 m^3 = 8.40E+05 yd^3

25. C. 2. d. Soil Disturbance
(1) Temporary = to be determined by another calculation
(2) Permanent = to be determined by another calculation

D. In Situ vitrification Tank Waste alternative
1. Remediation
a. Sand and gravel = 6.79E+05 m^3 = 8.90E+05 yds^3
b. Silt = NR
c. Rip Rap = NR
d. Soil Disturbance
(1) Temporary = To be determined by another calculation
(2) Permanent = to be determined by another calculation

2. Total alternative (Includes remediation and closure as landfill).
a. Sand and gravel = 1.103E+06 m^3 = 1.44E+06 yds^3
b. Silt = 3.77E+05 m^3 = 3.80E+05 m^3 = 5.00E+05 yds^3
c. Rip Rap = 6.38E+05 m^3 = 6.40E+05 m^3 = 8.40E+05 yds^3
d. Soil disturbance
(1) Temporary = to be determined by another calculation
(2) Permanent = to be determined by another calculation

E. Ex Situ Intermediate Separations Tank waste alternative Extensive Retrieval
1. Remediation
a. Sand and Gravel = 1.66E+06 m^3 = 2.18E+06 yds^3
b. Silt = NR
c. Rip Rap = NR
d. Soil Disturbance
(1) Temporary = to be determined by another Calculation
(2) permanent = to be determined by another Calculation

2. Total alternative (Includes remediation and closure as landfill).
a. Sand and gravel = 3.02E+06 m^3 = 3.95E+06 yds^3
b. Silt = 5.19E+05 m^3 = 6.80E+05 yds^3
c. Rip Rap = 8.78E+05 m^3 = 1.15E+06 yds^3
d. Soil Disturbance
(1) Temporary = to be determined by another calculation
(2) Permanent = to be determined by another calculation

25. F. Ex Situ No Separations Vitrification Tank waste alternative
Extensive Retrieval
1. Remediation
a. Sand and gravel = 2.95 E+06 m^3 = 3.86 E+06 yds^3
b. Silt = NR
c. Rip Rap = NR
d. Soil Disturbance
(1) Temporary = To be determined by another calculation.
(2) Permanent = To be determined by another calculation.

2. Total alternative (Includes remediation and closure as Land fill.)
a. Sand and gravel = 4.15 E+06 m^3 = 5.44 E+06 yds^3
b. Silt = 3.77 E+05 = 3.80 E+05 m^3 = 5.00 E+05 yds^3
c. Rip Rap = 6.38 E+05 = 6.40 E+05 m^3 = 8.40 E+05 yds^3
d. Soil disturbance
(1) Temporary = To be determined by another calculation
(2) Permanent = To be determined by another calculation

2. Total alternative (Includes Remediation and closure as Land fill.)
   a. Sand and Gravel = 2.31E+06 m^3 = 3.03E+06 yds^3
   b. Silt = 5.66E+05 m^3 = 7.42E+05 yds^3
   c. Rip Rap = 9.58E+05 m^3 = 1.26E+06 yds^3
   d. Soil Disturbance
      (1) Temporary = To be determined by another calculation.
      (2) Permanent = To be determined by another calculation.

I. Ex Situ / In Situ Combination 1 Tank waste alternative Extensive Retrieval of Liquid Waste/Solid Waste from 70 Tanks

1. Remediation
   a. Sand and Gravel = 9.47E+05 m^3 = 1.24E+06 yds^3
   b. Silt = NR
   c. Rip Rap = NR
   d. Soil disturbance
      (1) Temporary = To be determined by another calculation
      (2) Permanent = To be determined by another calculation

2. Total alternative (Includes Remediation and closure as Land Fill.)
   a. Sand and gravel = 1.81E+06 m^3 = 2.38E+06 yds^3
   b. Silt = 4.72E+05 m^3 = 6.18E+06 yds^3
   c. Rip Rap = 7.85E+05 m^3 = 1.03E+06 yds^3
   d. Soil Disturbance
      (1) Temporary = To be determined in another calculation
      (2) permanent = To be determined in another calculation

16. J. Ex Situ/In Situ Combination 2 Tank Waste alternative Extensive Retrieval of Liquid Waste/Solid Waste from 25 Tanks

1. Remediation
   a. Sand and Gravel = 1.01 E+06 m^3 = 1.32 E+06 yd^3
   b. Silt = NR
   c. Rip Rap = NR
   d. Soil Disturbance
      (1) Temporary = To be determined in another Calculation
      (2) Permanent = To be determined in another Calculation

2. Total alternative (Includes Remediation and Closure as Land fill)
   a. Sand and gravel = 1.63 E+06 m^3 = 2.13 E+06 yd^3
   b. Silt = 4.25 E+05 m^3 = 5.75 E+05 yd^3
   c. Rip Rap = 7.18 E+05 m^3 = 9.41 E+05 yd^3
   d. Soil Disturbance
      (1) Temporary = To be determined in another Calculation
      (2) Permanent = To be determined in another Calculation

K. Phased Implementation Phase I Tank Waste alternative

1. Remediation
   a. Sand and Gravel = 3.2 E+04 m^3 = 4.19 E+04 yd^3
   b. Silt = NR
   c. Rip Raps = NR
   d. Soil disturbance
      (1) Temporary = To be determined in another calculation
      (2) Permanent = To be determined in another calculation

2. Total alternative (Includes Remediation and Closure as Land fill.)
   a. Sand and gravel = 3.2 E+04 m^3 = 4.19 E+04 yd^3
   b. Silt = NR
   c. Rip Rap = NR
   d. Soil Disturbance
      (1) Temporary = To be determined in another calculation
      (2) Permanent = To be determined in another Calculation

25. L. Phased Implementation Phase II Tank waste alternative

1. Remediation
   a. Sand and Gravel = 1.20E+06 m^3 = 1.57E+06 yds^3
   b. Silt = NR
   c. Rip Rap = NR
   d. Soil Disturbance
      (1) Temporary = To be determined in another Calculation
      (2) Permanent = To be determined in another Calculation

2. Total alternative (Includes Remediation and Closure as Land Fill.)
   a. Sand and gravel = 2.56E+06 m^3 = 3.35E+06 yds^3
   b. Silt = 5.66E+05 m^3 = 7.42E+05 yds^3
   c. Rip Rap = 9.58E+05 m^3 = 1.26E+06 yds^3
   d. Soil Disturbance
      (1) Temporary = To be determined in another Calculation
      (2) Permanent = To be determined in another Calculation

The data utilized throughout item 25 above can be found in Table II above and in the support information for Table 5.16.1 given in Item 18 above.

26. Determine the input for Table 3.7.1 for columns (1) onsite Disposal volume (m^3) and (2) offsite disposal volume (m^3). Develop the new column for insertion for the Ex Situ/In Situ Combination 2 alternative.

A. assumed that the values for no action, long-term management, In Situ Fill and Cap, and In Situ Vitrification did not change with this revision. However the value entered under Fill and Cap appears extremely low at 50,000 m^3 of onsite Waste Disposal Volume.

B. Ex Situ Intermediate Separations
1. onsite Disposal volume
volume of LLW glass produced from input sheets
$v = 351,000\ m^3$

2. offsite Disposal volume
volume of HLW glass produced from input sheets
$v = 14,200\ m^3$

C. Ex Situ no Separations - Vitrification
1. onsite Disposal volume
volume of LLW glass produced from Input Sheets
$v = 0$
2. offsite Disposal volume
volume of HLW glass produced from Input Sheets
$v = 291,000\ m^3$

D. Ex Situ no Separations - Calcination
1. onsite Disposal volume
volume of LLW glass produced from Input sheets
$v = 0$

2. offsite Disposal volume
volume of HLW calcined product from Input sheets
$v = 67,000\ m^3$

26.E. Ex Situ Extensive Separations

1. Onsite Disposal Volume

Volume of LLW glass produced from input sheets

$v = 349,000\ m^3$

2. offsite Disposal volume

volume of HLW glass produced from Input sheets

$v = 667\ m^3$

F. Ex Situ/InSitu Combination 1

1 Onsite Disposal Volume

volume equals the amount of LLW and the liquid remaining

Volume of LLW glass produced from Input Sheets

$LLW = 215000\ m^3$

according to Footnote 3 $105,600\ m^3$ of waste remained in the tanks.

Σ LLW + Remained $= v = 215,000 + 105,600$

$v = 320,600\ m^3$

2. offsite Disposal volume.

volume of HLW glass produced from the input sheets

$v = 7,030\ m^3$

G. Ex Situ/InSitu Combination 2

1. offsite Disposal volume

volume of HLW glass produced from the input sheets

$v = 4,160\ m^3$

2. Onsite Disposal volume

Volume of LLW glass produced from input sheets

$LLW = 125000\ m^3$ table AI from WHC-SD-WM-EV-107

waste volume remaining = total volume − volume of 25 tanks assumed as Fullest tanks.

25 tank Volume =	7 Tanks	$30694\ m^3$
	8	35078
	6	26309
	3	13154
	1	3780
	Σ 25	$109015\ m^3$

$475917 - 109015$

$= 366902\ m^3$

6.G.2. waste volume = LLW + Remainder
= 125000 + 366902
= 491902 m^3

H. Phased Implementation (1 and 2)
1. onsite Disposal Volume
volume of LLW glass product from input sheets
$v = 351,000\ m^3$

2. offsite Disposal Volume
volume of HLW glass produced from input sheet
$v = 14,300\ m^3$

27. Determine the new values as revised by the new criteria for canisters, etc. for the sensitivity analysis for the Ex Situ Intermediate Separations alternative for presentation in the revised Table B.8.2.1 of appendix B.

A. Ex Situ Intermediate case of LLW glass loading of 10 weight % sodium oxide and the HLW glass loading of 15 weight % waste oxides [Low Loading].

Determine the Ratio of LLW and HLW and the combined ratio for determining many of the values to be found in the Resource Summary Table and used for Table B.8.2.1.

Low Loading Mass of LLW glass = 9.68 E+05 mTons
Number of Vaults = 99

Mass of HLW glass = 5.81 E+04 mTons.
Number of 1.17 m^3 Canisters = 1.89 E+04
Number of HMPCs = 4725
Number of Shield Casks = 4725

Number of 10 car trains to Repository = 4725 ÷ 10 = 472.5
= 473 Trips

27-A. Reference loading is the base case of 20% + 15% loadings

Mass of HLW glass = 3.73 E+04 MT

Mass of LLW glass = 6.45 E+05 MT

$$\text{Combined ratio} = \frac{LLW + HLW}{LLW + HLW} = \frac{968000 + 58100}{645000 + 37300} = \frac{1026100}{682300}$$

$$= \frac{1026100}{682300} = 1.504$$

LLW ratio = 1.501

HLW ratio = 1.558

Determine the raw water usage

Construction = NR

Closure = NR

operations = (1.504)(1.22 E+07) = 1.835 E+07 m^3

B. Determine the sanitary water requirements.

1. Closure - the increase is for the increased basins needed for the vaults.

66 vaults = 6.42 hectares = 64,200 m^2

99 vaults = a block 9 x 11 vaults. or 10 x 10 block.

= (10)(39) = 390 m + 18 m = 408 meters

= (10)(20) = 200 m + 18 m = 218 meters

= (218)(408) = 88944 m^2

= 8.8944 hectares

$$\text{ratio} = \frac{17.4495 + 8.8944}{17.4495 + 64.152} = \frac{26.3439}{23.8647} = 1.104$$

H_2O = (6.0E+04)(1.104) = 6.624 E+04

17. B. 2. operation Sanitary water

vitrifi H_2O = (3.8 E+06)(1.504) = 5.72 E+06

WR+T use = 2.0 E+06

3. Construction

WR&T = 9.4 E+03

Vitrifi = (4.926 E+05)(0.06)

= 29559

= 492,600 − 29559 = 463041

H_2O = 463041 + 46683

= 509124

= 5.09 E+05 m^3

HLW pad area

(3030)(6.6) = 19998 m^2

(4725)(6.6) = 31185 m^2

Ratio 31185 / 19998 = 1.559

Ratio of HLW/LLW = 58100 / 968000

= 0.06

C. Calculate total water

H_2O = (1.835 E+07) + (8.31 E+06) = 2.67 E+07 m^3

D. Determine the Electrical requirements for this case

1. Construction

WR&T = 2.6 E-01

vitrifi = (7.3 E+01) = (73)(0.06)(1.559)

= 23 + 7 = 8.0 E+01

2. operation

WR&T = 6.0 E-01

vitrifi = (1.08 E+04)(1.504) = 1.624 E+04

3. Closure

total = NR

7. E. Determine the Gasoline requirements.

1. Construction

WR&T = 3.3 E+02

vitrifi = (7300)(0.06)(1.559)

= 7300 + 683

= 7.983 E+03

total = 8313 = 8.31 E+03

2. operation

WR&T = 0

vitrifi = 5.1 E+01

New value = 99-10 = (89)(240)(3.785)(10^-3) = 8.09 E+01

3. Closure

tank stab = 4.01 E+01

anc Equip = 1.2 E+00

Barrier = (3.71 E+02)(1.104)

= 4.10 E+02

F. Determine the Diesel Consumption for this case

1. Construction

WR&T = 1.0 E+03

vitrifi = (2.01 E+04)(0.06)(1.559) = (= 1880)

= (2.01 E+04)(1880)

= 21980 = 2.20 E+04 Pad increased area

2. operation

WR&T = 1.02 E+03

vitrifi = (1.734 E+03)(1.504) = 2.60 E+03

vaults = (89)(25530)(3.785)(10^-3) = 8.6 E+03

vitrifi = 8.6 E+03 + 2.6 E+03 = 1.12 E+04

total = 1.22 E+04

17.7.3. Closure

Tank Stab = 6.4E+03

one Equip = 8.02E+02

Barrier = (.164)(6.3+E04) = 6.96E+04

G. Determine the new Kerosene requirement

Kerosene = (.504)(6.58E+04) = 9.90E+04 m³

H. Determine the concrete usage, sand, gravel, and cement

1. Construction

WR&T ≡ no change = 5.9E+04 m³

Sand = 3.98E+04

gravel = 2.34E+04

Cement = 1.48E+04

Vitrifi = 4.82E+05 + Mercaul Pad = 2237 m³

= 482000 + 2237

= 4.842E+05 m³

Sand = 3.264E+05 m³

gravel = 1.917E+05 m³

Cement = 1.211E+05 MT

2. operation

WR&T = NA

vitrifi =

(1) LLW vaults = (89)(4300) = 382700 E+05 m³

Sand = 2.58E+05

gravel = 1.52E+05

Cement = 9.57E+04 MT

2. HLW Shield Casks

(90.7)(1/1.6)(4725) = 2.67848 E+05

Sand 1.81E+05

gravel 1.06E+05

Cement 6.7EE04

27 Q.3. Determin Concrete usage, Sand, gravel and cement

a. Construction

WR+T = no change

Vitrifi = 4.82E+05 − decreased storage Pad volume.

= 482000 − 1663

Concrete = 4.80E+05 m^3

Pad area (3070)(6.6)
new Pad area (1770)(6.6)
decrease = 8316 m^2
×0.2 = 1663 m^3

Sand = 3.24E+05 m^3
gravel = 1.90E+05 m^3
Cement = 1.20E+05 mT

b. Operation

WR+T = NA

Vitrifi =

(1) LLW vaults = (30)(4300) = 1.29E+05 m^3 Concrete
Sand = 8.70E+04 m^3
gravel = 5.12E+04 m^3
Cement = 3.23E+04 mT

(2) HLW shield Cells

= (90.7)(1/1.6)(1770) = 160337
= 1.0034E+05 m^3
Sand = 6.76E+04 m^3
gravel = 3.97E+04 m^3
Cement = 2.51E+04 mT

4. Determine the Carbon steel usage

decrease pad area = 92×92 m^2

a. Construction

Steel = (0.000123)(92)(2)(460)(7) = 74 mT
= 97100 − 74
= 97026 = 9.70E+04 mT

7. Q 4. b. operation steel

HMPCS = (6.5)(1770) = 1.1505 E+04

LLW vaults = (30)(500) = 1.50 E+04

LLW boxes = (13.076)(40)(1263) = 6.606 E+05

Σ = 6.87 E+05 mT

5. determine the stainless steel

a. operation = (7080)(1.125) = 7965 mTons

6. Σ of Steels

Fuel Core = 7.94 E+05 + 2.7 E+04 + 2.3 E+03
= 823300 = 8.23 E+05 mT steel total

Base Core = 1.73 E+06 + 3.26 E+04 + 2.3 E+03
= 1.76 E+06 mT steel total.

Low Core = 1.83 E+06 + 4.03 E+04 + 2.3 E+03
= 1.87 E+06 mT steel total.

7. determine the Barrow material required for the vault Barriers.

vault area for 48 vaults = 4 x 10 block of vaults.

Barrier area = (10)(39) = 390 + 18 = 408 meters
= (4)(20) = ~~80~~ 60 + 18 = ~~178~~ 98 meters

area = (408)(~~178~~ 98) = ~~72624~~ 39984 m^2
= ~~7.2624~~ 3.9984 hectares

Silt = 3.7~~7~~ E+05 m^3 + (2)(~~72624~~ 39984) m^3
= 3.77 + ~~145248~~ 79968
= ~~5.22~~ E+05 m^3 4.57

J. Determine stainless steel requirements

1. Construct no change

2. operation = SS Canisters @ 1.17 m^3

= (1.125)(18900) = 2.13E+04 mT

K. Hastelloy alloy or Inconel

no change.

FORM 91-005-1 (4/81)

M. L. Compute the glass forms required.

LLW ~~4.66E+04~~ 8.62E+05 mT HLW 4.66E+04 mT

alumina	1.32E+04	0.045	B_2O_3	1.75E+03	0.129
CaO	3.87E+04	0.138	Li_2O	5.00E+02	0.037
SiO_2	2.29E+05	0.815	SiO_2	1.13E+04	0.834
Σ = 280900			Σ = 13550		

alumina	3.88E+04	B_2O_3	6.01E+03
CaO	1.19E+05	Li_2O	1.72E+03
SiO_2	7.63E+05	SiO_2	3.89E+04

Σ SiO_2 = 7.42E+05

total Σ = 9.08E+05

M. Σ of Carbon Steel, Stainless Steel and alloy Steel.

Low = 1.87E+06 mT Base = 3.04E+05

N. Develop the amount of Barrow silt needed for the Low Case

Basin area for 99 vaults = 88944 m^2

silt is 2 meters thick

volume = 177,888 m^3

= 1.78E+05 m^3

amount for tank farm = 3.77E+05 m^3

Σ = 5.55E+05 m^3

O. Develop the amount of Barrow riprap needed for the low case

Basin for tank farm = 6.38E+05

(174495 m^2)(1.5 m)

= 261743 m^3

(638000) ÷ (261743) = 2.434

area of 99 vaults = 88944 m^2

×1.5 = 133416 m^3

×2.434 = 3.25E+05 m^3

Σ = 6.38E+05 + 3.25E+05 m^3

= 9.63E+05 m^3

17. P. Determine Barrow site sand and gravel.

1. Construction

	sand	gravel
WR&T	3.98E+04	2.34E+04
Utilities	3.26E+05	1.917E+05
Σ =	3.66E+05	2.15E+05

Σ = 5.81E+05

2. operation

	Sand	gravel
SLW vaults	2.58E+05	1.52E+05
HLW Shield Cask	1.81E+05	1.06E+05
Σ	4.39E+05	2.58E+05

Σ 6.97E+05

3. Closure

	sand	gravel
Tank Slab	3.6E+03	2.1E+03
onc Equip	9.2E+03	5.4E+03

4. Barrier

Pea gravel = 8760 m³ per 8 hectares

~~for~~ = 19107 m³ per 17.4485 hectares

99 Vaults = 88944 m² = 8.8944 hectares

pea gravel = 9739.368 m³ for 8.8944 hectares.

Pea gravel = 19107 m³ + 9739.368 m³

= ~~1.165E+~~ 2.884E+04 m³

66 vaults = 64200 = 6.42

= 7030 m³ pea gravel

8760 + 7030

= 1.58E+04

FORM 91-005-1 (4/81)

27. P. 4. Barrier gravel/sand
Cubic meters of material = 2.38 m^3/m^2

99 vaults = 88944 m^2
= 2.117 E+05 m^3

Σ 2.117 E+05 + 2.88 E+04
= 2.41 E+05 + 4.15 E+05
= 6.56 E+05

Q determine data for high case for table B.8.2.1.

[High Loading]

Mass of LLW glass = 387000 MT
Number of Vaults = 40

Mass of HLW glass = 21800 MT
Number of 1.17 m^3 Canisters = 7080
Number of HMPCs = 1770
Number of Shield Casks = 1770

Number of 10 car trains to Repository = 1770 ÷ 10 = 177

1. Determine ratio to the Base case
Mass of LLW = 6.45 E+05 MT
Mass of HLW = 3.73 E+04 MT

HLW ratio = 21800/37300 = 0.5845
LLW ratio = 387000/645000 = 0.6

overall ratio = 408800/682300 = 0.5992

2. Determine the Kerosene requirement.

m^3 = (6.58 E+04) (0.5992) = 3.943 E+04 m^3

7. Q. 9. C. Vault Barrier area = 3 9984 m^2

(2.38)(39984) =

pea gravel = 8.760 m^3 for 8 features

= (8760) 4/8 = 4380

add tank farm to both values.

= 4.15 E+05 + 9.52 E+04 5.10 E+05 m^3

= 19107 m^3 + 4380

= 2.35 E+04 m^3 pea gravel

10 Compute the glass formers required here

LLW = 281000 MT HLW = 10300 MT

alumina	0.045	B_2O_3	0.129
CaO	0.138	Li_2O	0.037
SiO_2	0.815	SiO_2	0.834

	alumina	12645.96	1.26E+04	B_2O_3	1328.7	1.33E+03
3.88E+04	CaO	~~126 46.96~~	38778.0	Li_2O	381.1	3.81E+02
	SiO_2	229015.0	E+05	SiO_2	8590.2	8.59E+03

ΣSiO_2 = 237605 = 2.38 E+05 MT

11. Permanent Land Commitment

Base Case ± Change in hectares for LLW Barrier.

Low Case = 46 + [8.8944 − 6.4200] = 49 ha

High Case = 46 − [6.4200 − 3.9984] = 43 ha

8. Develop new data for Table D. 4.8.1 for the Ex Situ / In Situ Combination 1 alternative. also Develop data for this Table for the Ex Situ / In Situ Combination 2 alternative.

A. Separation and Vitrification Emissions

1. 241 am in Table = 3.08E-03 Ci/yr for 20 years for Combo 1. New period for Combo 1 is 18 years; the new value is now (3.08E-03) (20/18) = 3.42E-03 Ci/yr.

2. 241 am for Combo 2

(3.08E-03)(20) (÷ 0.95) = 68.444
× 0.73 = 49.96
÷ 18 = 2.78E-03 Ci/yr.

3. 14C for Combo 1

= (2.21E+02) (20/18) = 2.46E+02 Ci/yr

4. 14C for Combo 2

(2.21E+02)(20) (÷ 0.95) = 46.526315
× 0.80 = 37.22
÷ 18 = 2.07 E+02 Ci/yr.

5. 137 Cs for Combo 1

= (1.49E+00) (20/18) = 1.66 Ci/yr.

6. 137 Cs for Combo 2

= (1.49E+00) (20) (÷ 0.89) = 33.483146
× 0.83 = 27.791011
÷ 18 = 1.54 E+00 Ci/yr

7. I 129 for Combo I

= (38 E+00) (0.9165) ÷ 18
= 34.827 ÷ 18
= 1.94 E+00 Ci/yr

8. 129 I for Combo II

= (38 E+00) (0.81) (÷ 18) = (30.78) ÷ (18)
= 1.71E+00 Ci/yr.

28. A. 9. 239 Pu for Combo 1

$= (6.71E-04)(20/18) = 7.46E-04$ Ci/yr.

10. 239 Pu for Combo 2

$= (6.71E+04)(20)(\div 0.78) = 172.05$

$= (172.05)(0.29) = 49.8948$

$\div 18 = 2.77E-04$ Ci/yr.

$= (0.21)(39.72)(\div 18) = 0.4634E-02$

$= 4.63E-03$ Ci/yr.

15. 90 Sr for Combo 1.

$= (1.47)(20/18 = 1.63E+00$ Ci/yr.

16. 90 Sr. for Combo 2

$= (1.47E+00)(20)(\div 0.6538) = 44.96788$

$= (0.36)(44.96788) = 16.188436 \div 18$

$= 0.8993575 = 9.0E-01$ Ci/yr.

17. 99 Tc for Combo 1

$= (8.46E-04)(20/18) = 9.4E-04$ Ci/yr.

28. A. 18. 99 TC for Combo 2
(8.46E-04)(20)(÷91.62) = 18467583
(18467583)(0.85)(÷18) = 8.72 E-04 Ci/yr

19. 93 Zr for Combo 1
= (8.29E-03)(20/18) = 9.21E-03 Ci/yr.

20. 93 Zr for Combo 2.
= (8.29E-03)(20)(÷0.664) = 249.69879
= (249.69879)(0.11)(÷18) = 1.53 E-03 Ci/yr.

B. Retrieval Emissions

1. 90 Sr for Combo 1
= (5.00 E-04)(23/20) = 5.75 E-04 Ci/yr.

2. 137 CS for Combo 1
= (2.00 E-03)(23/20) = 2.30 E-03 Ci/yr

3. 129 I for Combo 1
= (4.00 E-03)(23/20) = 4.6 E-03 Ci/yr

4. 90 Sr for Combo 2
= (5.00E+04)(23)(÷0.76) = 151.32 E-04
= (151.32E-04)(0.36)(÷20) = 54.474 ÷ 20
= 2.72E-04 Ci/yr.

5. 137 Cs for Combo 2
= (2.00E-03)(23)(÷0.888) = 51.8018
= (51.80 E-03)(0.83)(÷20) = 2.15E-03 Ci/yr.

6. 129 I for Combo 2
= (4.00 E-03)(23)(÷0.9165) = 100.382
= (100.382)(0.81) ÷ (20) = 81.31 ÷ 20
= 4.07 E-03 Ci/yr

B.c. Continuous operations for Combination 1 and 2 alternatives.

1. Tank Farm emmissions

a. Total alpha for Combo 1

$= 2.88E+08 \ (29/26) = 3.21E+08$ Ci/yr.

b. Total alpha for Combo 2

$= (2.88E-08)(29) \div (1-0.78) = 379.64E-08$

$= (379.64E-08)(1-0.29) \div (25) = 9.263$

$= 9.26E-08$ Ci/yr.

In consideration that the number of double shell tanks taken in either Combo 1 or Combo 2 choice are nearly the same the Evaporator 2 emissions and the gravel and fill emissions will be the same for either combination. adjustment must be applied for any difference in the time frame applied.

The continual operations for tank farm emissions and evaporator emissions will not change. It is assumed that they will remain the same for the period now until there is activity for remediation of the liquid in the area.

2. Treatment (gravel fill) area

1. Gravel and fill Emissions adjusted for new duration and to Generate Combo 2 table.

a. total alpha for combo 1 and 2.

$= (4.92E-11)(20/18) = 5.47E-11$ Ci/yr.

b. Total Beta for Combo 1 and 2

$= (1.34E-09)(20/18) = 1.49E-09$ Ci/yr.

c. 90 Sr for Combo 1 and 2

$= (1.45E-08)(20/18) = 1.61E-08$ Ci/yr.

18. D. 1. d. 137 Cs for Combo 1 and 2
= (9.01 E-08) (20/18 = 1.00 E-07 Ci/yr.

e. 129 I for Combo 1 and 2

= (7.85 E-08) (20/18) = 8.72 E-08 Ci/yr.

2. Evaporator 2 emissions

a. total alpha for combo 1 and Combo 2.
= (1.04 E-04) (20/18) = 1.16 E-04 Ci/yr.

b. Total Beta for Combo 1 and Combo 2

= (8.04 E-05) (20/18) = 8.93 E-05 Ci/yr

29. Develop data changes for tables D. 4. n. 1, .2, .3, and .4 where needed for each of the alternatives. For n = 1 through 13.
A. The no action alternative
1. Table D.4.1.1, There is no change.

2. Table D.4.1.2, There is no change

3. Table D.4.1.3, there is no change. The duration of activity remained the same.

4. Table D.4.1.4, There is no change.

B. Long-term management alternative

1. Table D.4.2-1, There is no change because the duration of activity did not change.

2. Table D.4.2.2, There was no change.

3. Table D.4.2.3, There was a change in the duration of one activity which did not affect the other tables.

29. B. 4. Table D-4-2-4, there was no change

c. In Situ Fill and Cap alternative

1. Table D.4.3.1 there are some change because the time duration changed from 8 years to 9 years. for the treatment operations

a. Evaporator total alpha

$= (1.04E-04)(8/9) = 9.24E-05$ Ci/yr

b. Evaporator total Beta

$= (8.04E-05)(8/9) = 7.15E-05$ Ci/yr

c. Gravel Fill Emissions

1. total alpha

$= (9.83E-11)(8/9) = 8.74E-11$ Ci/yr.

2. total Beta

$= (2.69)(E-09)(8/9) = 2.39E-09$ Ci/yr

3. 90 Sr

$= (2.91E-08)(8/9) = 2.59E-08$ Ci/yr

4. 137 Cs

$= (1.81E-07)(8/9) = 1.61E-07$ Ci/yr

5. 129 I

$= (1.57E-07)(8/9 = 1.40E-07$ Ci/yr

2. Table D-4-3-2, There is no change

3. Table D-4.3.3, There was change because the duration period for some activities changed.

4. Table D-4-3-4, There was no change.

D. In Situ Vitrification alternative

29.D.1. Table D.4.4-1, Some data changed because the time duration for some activities changed. The treatment operations period changed from 9 years to 13 years.

a. DST Evaporator Emissions

1. total alpha
$= (1.04\ E-04)(9/13) = 7.2\ E-05$ Ci/yr.

2. Total Beta ⇒
$= (8.04\ E-05)(9/13) = 5.57\ E-05$ Ci/yr.

b. In Situ Vitrification Emissions

1. 241 Am
$= (1.90\ E-06)(9/13) = 1.32\ E-06$ Ci/yr.

$= (1.40E-02)(15/14) = 1.50E-02$ Ci/yr.

29. F. 2. Table D.4.6.2, There was no change in the parameters.

3. Table D.4.6.3, There were changes due to time duration changes for some activities in vitrification.

4. Table D.4.6.4, There were no changes to this table.

5. Table D.4.6.16, There were changes due to time duration changes for some activities in calcination.

6. Table D.4.6.17, There were no changes required.

G. Ex Situ Extensive Separations alternative

1. Table D.4.7.1, There were changes caused by changes in the duration times of several activities - Retrieval 23 yrs to 20 yrs and separations and treatment 20 to 19 years.

a. Retrieval Emissions (23/20)

1. Sr-90

$= (5.00E-04)(23/20) = 5.75E-04$ Ci/yr.

2. Cs-137

$= (2.00E-03)(23/20) = 2.30E-03$ Ci/yr

3. I-129

$= (4.00E-03)(23/20) = 4.6E-03$ Ci/yr.

b. Separation and Vitrification emissions (20/19)

1. Am-241

$= (2.40E-03)(20/19) = 2.53E-03$ Ci/yr.

2. C-14

$= (2.50E+02)(20/19) = 2.63E+02$ Ci/yr.

3. Cs-137

$= (5.70E+01)(20/19) = 6.00E+01$ Ci/yr

29. D.1.b.4. I-129
$= (38.0)(1/19) = 2.0E+00$ ci/yr.

5. Pu-239
$= (8.90E-04)(20/19) = 9.37E-04$ ci/yr

6. Ru-106
$= (1.70E-07)(20/19) = 1.79E-07$ ci/yr

7. SR-90
$= (1.1E-02)(20/19) = 1.16E-02$ ci/yr

8. Tc-99
$= (2.3E-01)(20/19) = 2.42E-01$ ci/yr.

9. Zr-93
$= (5.50E-04)(20/19 = 5.79E-04$ ci/yr.

2. Table D.4.7.2, There were no parameter changes

3. Table D.4.7.3, There were changes due to changes in the time duration for the various activities.

4. Table D.4.7.4, There were no changes in these values.

H. Ex Situ / In Situ Combination 1 alternative
1. There were changes to Table D.4.8.1 due to changes in the duration times of several of the activities. Retrieval changed from 23 to 20 years and operation changed from 20 to 18 years.

a. Evaporator & Emissions under treatment (gravel fill)

The numbers for this changed table are calculated in item 28 above in this calculation.

2- Table D.4.8.2, changed the table title to reflect Combination 1.

19. H. 3. table D.4.8.3, Table changed due to duration time changes for several activities.

4. Table D.4.8.4, was changed in title to reflect the Combination 1 alternative.

I Ex-Situ/In-Situ Combination 2 alternative.

1. Table D.4.8.1 (b) was created for this new alternative and is based on the table in H.1 above.

2. Table D.4.8.2(b) was created for this new alternative and is carried forward as the same as for the table in H.2. above. The data matches data in the same table for other alternatives with the same activities.

3. Table D.4.8.3 (b) was created for this new alternative and is carried forward as the same as the Table in H-3. above. Some of the duration times however are different.

4. Table D.4.8.4(b) is carried as applicable and is the same as Table D.4.8.4(a) in H-4 above.

J. Phased Implementation alternative - phase 1.

1. Table D.4.9.1 has some changes. a value for I-129 was added.

I-129 = 38 — fraction of material processed in phase I.

(38)(0.0145) = 0.55 — Metric tons in phase 1

$\frac{10074}{692674} = 0.0145$

(0.55 ÷ 2) = .2755

÷ 10 = 0.02755

= 2.76E-02

Phase 1
HLW = 1314 MT
LLW = 8760 MT

Phase 2
HLW = 37600 MT
LLW = 645000 MT

2. Table D.4.9.2, There were no parameter changes.

29. J. 3. Table D.4.9.3, There were some changes due to time duration changes.

4. Table D.4.9.4, There were no changes here.

5. Table D.4.9.16, There were changes to this Table because several time duration changes occurred.

a. Continued operations emissions remain the same.

b. Retrieval operations emissions change - Duration change (22/20)

1. Sr-90
$= (5.00E-4)(22/20) = 5.5E-04$ Ci/yr

2. Cs-137
$= (2.00E-03)(22/20) = 2.2E-03$ Ci/yr

3 I-129
$= (4.00E-03)(22/20) = 4.4E-03$ Ci/yr.

c. Separations and treatment Emissions
(1.) Phase 1 column is deleted There will be two 100-Ton/day LAW units and a 10-Ton/day HLW unit.

(2.) Phase 2. duration period has changed (26/17).

(a) am-241
$= (3.08E-03)(26/17) = 4.71E-03$ Ci/yr.

(b) C-14
$= (2.21E+02)(26/17) = 3.38E+02$ Ci/yr

(c) Cs-137
$= (1.49E+00)(26/17) = 2.28E+00$ Ci/yr.

(d) I-129 $= (37.43)(1/17) = 2.20E+00$ Ci/yr.

29. J.5.C.2.(e). Pu-239
$= (6.70E-04)(26/17) = 1.03\ E-03\ ci/yr$

(f) Ru-106
$= (4.8E-07)(26/17) = 7.34\ E-07\ Ci/yr$

(g) Sm-151
$= (1.43E-02)(26/17) = 2.19\ E-02\ ci/yr.$

(h) Sr-90
$= (1.40E+00)(26/17) = 2.14\ E+00\ Ci/yr.$

(i) Tc-99
$= (8.46E-04)(26/17) = 1.29\ E-03\ ci/yr$

(j) Zr-93
$= (8.29E-03)(26/17) = 1.27\ E-02\ Ci/yr$

6. Table D.4.9.17, There were no parameter changes for this Table.

7. Table D.4.9.18, There were changes due to to changed period duration for the activities.

8. Table D.4.9.19, There were no changes recorded for this table.

H. Capsule No action alternative
1. Table D.4.10.1, there was no change in value

2. Table D.4.10.2, There were no parameter changes

3. Table D.4.10.3, There were no changes in values

I. Capsule onsite Disposal.
1. Table D.4.11.1, Correct the title from "No action" to "onsite Disposal" alternative

2. Table D.4.11.2, There were no parameter changes

19. L. 3. Table D. 4.11.3, There were no changes to be inserted now.

4. Table D. 4-11.4, There were no changes to be inserted now.

M. Capsule overpack and ship alternative.

1. Table D. 4.12.1, There were no changes.

2. Table D. 4.12.2, There were no parameter changes

3. Table D. 4.12.3, there were changed period durations inserted, The other values may change accordingly.

4 Table D. 4-12-4, No changes to be made at this time.

N. Capsule vitrify with tank waste alternative.

1. Table D. 4.13.1, no changes were initiated.

2. Table D. 4-13.2, No parameter changes.

3. Table D. 4.13.3, Inserted new period duration values — (28 years 19) and (18 yrs)

4. Table D. 4.13.4, No changes now but later.

30. The Ex Situ / In Situ Combination 1 alternative has been re-evaluated and new numbers generated that are essential in calculating the Resource and transportation quantities for the TWRS FEIS.
A. The permanently committed land will be determined later.
B. The Temporary committal of land will be determined later.
C. The Borrow pit disturbed area will be determined later.
D. Calculate the raw water usage (m^3)

Determine the new HLW and overall ratio. The SSU Ratio did not change See page 65, 4.D of this Calculation.

30. D.

HLW mass of glass = 26300 MT
Canisters = 8547
Hampers = 2137

HLW ratio = 26300/27200 = 0.9007

Overall ratio = (26300)+(395000)/(484000)+(27200)
= 421300/511200
= 0.8241392
= 0.824

Raw water = (0.824)(9.35E+06) = 7.71E+06 m^3

E. Determine the Sanitary water usage.

Original Concrete = 2.75 E+05 m^3

additional area + Volume of Concrete
= (2137 - 853) (6.6) (0.2) = 1694.88 = 1695 m^3
(1248) (8474.4)

New Concrete = 276695 m^3

Ratio = 276695/275000 = 1.0061636

1. Construction use of Sanitary water
= WR&T = 9.4E+03 m^3
= vitrifi = (409600) (1.006164)
= 412124.77
= 4.12E+05 m^3
total = (4.12)+(9.4) = 4.22E+05 m^3

32. Generate new Revised tables for appendix G.

A. Table G. 3-1-19

Using Table 5.3-1 Source types and locations for cross reference of TF "n" E or W nomenclature to the more routine nomenclature of alphabetic letters ~~Correlation~~ check the input values from the Routine tank emissions data sheets (and summary) to create these new tables.

Note: the Az Ay emissions divide (50%) to each TF6E and TF7E.

B. Table G. 3.1.20

Note: To account for increased emissions during retrieval TF6W is equal to 3 times the emissions from the highest TF during Routine operations.
[See page G-7 - noted text.]

C. Table G. 3.1.22

NOTE: to account for increased emissions during gravel fill, TF6W = 10 times the highest emission from the TFs during routine operations times 0.16

The 0.16 = 16 tanks in TF6W × (3 days to fill a tank) × (1/300 ops days/year)

D. Table G. 3-1.23

No peak values applied to TF6W

12. E. Table G. 3.1.24

Here TFGW = 3X maximum TF value for each isotope.

F. Table G. 3.1.25

Same as for G. 3-1-24

G. Table G. 3-1-26

Same as for G-3-1-24

H. Table G. 3-1-27

Here Tank TFGW ≅ 3X maximum TF value for each isotope divided by 2., or 10 times the maximum value times 0.16
= (1.5 + 1.6) ÷ 2 = 1.55

Here tank TFSW = the value for TFGW.
Since both tank farms are next to each other retrieval from one and gravel fill at the other equals the bounding conditions.

I. Table G. 3.1.28

Same as for Table G. 3-1.19

J. Table G. 3-1.29

Same as for Table G. 3-1.24

K. Create Table for Combination 2 alternative.

Same as for G. 3.1.27 using same peaking values as the bounding case. understandably the factor would be lower for TFGW; but this case would still be the Conservative bounding case.

33. Tabulation of alternative, canister size and number of canisters of HLW waste.

alternative	Canister Size	Number HLW Canisters
A. Ex Situ Intermediate Sep.	1.17 m^3	12,123
B. Ex Situ No Separations, vitr.	10 m^3	29,115
C. Ex Situ No Separations, Calci	10 m^3	10,300
D. Ex Situ Extension Sep.	1.17 m^3	667
E. Ex Situ/In Situ Combination 1	1.17 m^3	8,547
F. Ex Situ/In Situ Combination 2	1.17 m^3	4,940
G. Phased Implementation	1.17 m^3	12,220

Phase 1 LAW on site transfers
= 87600 MT (2.63)(0.7)
= 47582.834 m^3 (2.6)
= 18301.09.
@ 3/trip = 6100 trips to the B vault vaults and then to the phase 2 vault burial area.
@ 3 boxes/trip ≃ 27 trips per day. (1 for each plant)

34. Description of changes in Mileage numbers occurring in appendix E and in Table B.11.0.8.

a consistent basis for loading was applied to all of the alternatives. Bulk materials such as cement and the flux materials were estimated on 100 ton rail hopper cars and not trucks. Points of origin were set at Seattle

or Portland for all rail car (train) make up. Some trucks were used as a Seattle/Portland point of origin. Many trucks were given a point of origin from the tri-cities. This depended on the normal availability of material source.

Previously 6 or 8 cubic yard concrete trucks original from the tri-cities. Now this is a site function of the batch plant. The difference between concrete and its components were identified as to source for hauling. as noted above all cement comes by 100-ton rail hopper car. Concrete is Batch hauled by 8 Cubic yard trucks on site. The sand and gravel required is hauled from the borrow pit in 20 cubic yard (eff 16 Cu yd) dump trucks (these replaced the previous 10 cu yd (8 cu yd eff) trucks. The 8 cu yd trucks are now used only in Excavation, backfill and trash hauling.

Previously it showed some concrete being shipped from Seattle/Portland. now only Cement Comes from Seattle/Portland and is estimated as 100-ton hopper car.

Previously it was not identified as to which glass formers ~~and~~ which chemicals came by truck or by rail and whether Oxygen was brought in or supplied from an air separation plant. All oxygen was assumed to be generated on site as a part of the plant ~~operating cost~~ operations.

all Steel products were shipped by Rail on 65 Tons per rail Car, again Portland/Seattle as a point of origin.

Most trains were considered 20 car trains. In two instances, however, the trains became single car trains.

35. Generate values to fill Table 3.11.0.3 for Radiological Emissions. Values generated for the phased implementation phase 1 sections and Transcribed values from Dave Stein for the Combination & column.

waste from phase 1 in Metric Tons = (87600) + (1314)
= 88914 mt

total waste phase 1 and 2 in Metric Tons = (88914) + (645000) + (37600)
= 771514 mt

Phase 1 percent of total = [(88914) ÷ (771514)] (100)
= 11.525 %

c. Rip Rap (Basalt) = 9.58E+05 m^3

total = 4.084E+06 m^3 = 5.35E+06 yd^3 = 1.445E+08 ft^3

40. Verification check for quantity of Rip Rap (Basalt) for barrier use.

34300	77300	834613 cu yds = 637109 m^3
27000	60113	
61200	46200	6.38E+05 / 6.371E+05 = 1.0014126
63600	44100	
53000	35800	tank farm = 17.4495 ha
62300	19300	= 174495 m^2
54000	19300	@ 1.5m deep = 261742.5 m^3 = 2.62E+05 m^3
61200	27600	
63700		6.38E+05 / 2.62E+05 = 2.435
34600		
834613 cu yds.		

10. a. 99 vaults = 88944 m^2 @ 1.5 m deep = 1.334 E+05 m^3
b. 66 vaults = 64200 m^2 @ 1.5 m deep = 9.6300 E+04 m^3
c. 40 vaults = 37932 m^2 @ 1.5 m deep = 5.6898 E+04 m^3

a. @ 2.435 1.334 E+05 m^3 = 3.25 E+05 m^3
b. @ 2.435 9.6300 E+04 m^3 = 2.345 E+05 m^3

+ TF = (2.345 + 6.37)
= 8.72 E+05 m^3

a = (3.25) (6.37) = 9.62 E+05 m^3

(5.69 E+04)(2.435) =
1.3855 E+05 m^3

c = 7.85 E+05 m^3

(6.37 E+05) + (1.39 E+05) = 7.76 E+05 m^3

11. Dump truck sizing 20 cu yd. dump trucks.

20 cu yd = 540 ft^3

assume Trailer 1. 8' wide and 5' deep; Length = 14 ft
2. 8' wide add 4' deep; Length = 17 ft
3. 8' wide and 3' deep; Length = 23 ft
4. 7' wide and 3' deep; Length = 26 ft

for example, trailer could be 50' long with a 5' depth and 7' width = 1750 ft^3 = 64.8 cu yd; effective load of 52 cubic yards.

Concrete assumed as:
63% sand (Included 7% wastage)
37% gravel (" 7% ")
5 sacks mix = 5 sacks / cu yd. ≈ 500 LBS / cu yd.

12. Vault size

(35 meters) (15 meters) = 525 meters^2

for 5300 m^3 ≅ 10.09524 meters
= 10.1 meters ~~2.6~~

Boxes for LAW = 1.2 x 1.2 x 1.8 meters. = 2.6 m^3
= 6.84 mT/box
= 7.5 tons/box

10/1.2 = 8.4 = 8 = 96 per ~~column~~ Row
15/(1.2) = 12.5 = 12

35/1.8 = 19.4 = 19 = 1824 boxes

(1.8)(1.2)(4) + (1.2 x 1.2)(2) = (8.64 m^2) + (2.88 m^2) = 11.52 m^2
@ 0.0125 m thick = 0.144 m^3 @ 7 mgr/m^3
= 1.008 mgr/box

for vault = (1824)(1.008) = 1838.592
= 1.84E+03 mT CS/Vault for LLW Container.

For example. 40 full Vaults = 7.36 E+04 mT CS. for LLW Containers.

For Interim storage of Phase I LAW

4 Grout vaults per (W) Report will hold 22,080 boxes of LAW at 1.2m x 1.2m x 1.8 m = 2.6 m^3 of waste.

for phase I 87600 MT LLW to be produced
= (87600)/(2.63)(0.7) = 33308/0.7 = 47583 m^3

= 47583/2.6 = 18,301 boxes
915 boxes/plant/year (365)(0.6) = 219
at 0.60 eff = 915/219 = 4.2 boxes/day/plant

4 Grout vaults will hold the LAW until Phase I is ready.

43. Estimate HLW interim storage pad area needed.

A. Ex situ Intermediate Separations layout
See figure 3.4.6 and B.3.5.3

Pad shown ≈ 270 m wide by 400 m long.
= 108000 m²

HMPCs and Shielding Casks require
(3030)(6.6) ≈ 19998 m²
add 40% for spacing = (19998)(1.4) = 279972 m²
≈ = 168 m x 168 m

Pad as shown is sufficient.

B. Ex situ No Separations Facility Layout
See figure B.3.6.1
Pads shown ≅ (140 m) x (540 m) (3) = 226,800 m²
(140 m) x (300 m) (1) = 42,000 m²
Σ = 268,800 m²

HMPCs and shield casks required
(29100)(6.6)(1.4) = 268 884 m²

4 pads are sufficient for the estimated HLW interim storage

C. Ex situ Extensive Separations Facility Layout
See figure B.3.7.1

Pad shown ≅ 60 m x 130 m = 7800 m²

HMPCs and Shield Casks required
(143)(6.6)(1.4) = 1321 m² ≈ 37 m x 37 m

pad as shown sufficient for HLW interim storage

JACOBS ENGINEERING GROUP INC.

DATE 7-30-96 SUBJECT Resource Summary Table B.11.0.3 and transportation tables SHEET NO. 393 of 393

BY RDW CHKD. JOB NO. 01K47101

43. D. phased implementation
see figures 3.14.16 and B.3.9.3

same as A above, 1 cask pad sufficient for HLW interim storage.

E. Ex Situ/In situ combination 1

pad required for HMPCs and shield casks for HLW
$= (2137)(6.6)(1.4) = (14104\ m^2)(1.4)$
$= 19746\ m^2$
$S \cong 141\ m \times 141\ m$

pad shown, estimated as 270 m wide x 280 m long

F. Ex Situ / In Situ Combination 2.

pad required $= (1235)(6.6) = 8151$
$(8151)(1.4) = 11411\ m^2$ $S \approx 107\ m \times 107\ m$

pad shown, estimated at 270 m wide by 280 m long

CALCULATION COVER SHEET

DISCIPLINE & TITLE ENGINEERING - Calculation of Data Revisions for Draft TWR-EIS

ORIGINATOR Ronald D. Weed DATE 2-15-96

REVISION NO. 0

OBJECTIVE Calculate DATA FOR TRANSPORTATION Evaluations BASED ON REVISED FROM table B.10.0.3.

METHODOLOGY applied INPUT data to obtain the new values FOR inclusion IN THE TRANSPORTATION tables and Accident ANALYSIS WORK WITHIN OTHERS SECTIONS OF THE TWRS-EIS.

ASSUMPTIONS See Calculation. sheet 1 of contains a listing of the tables and calculations covered within this Calculation.

Sheet A-13
REW 7-30-96

Assumptions:
1. HLW glass waste oxide loading basis to be ~20 wt% waste oxides (excluding Na2O and SiO2) following a 1.2 blending factor
2. Using the WHC engineering data package material balance calculate the waste oxide loading
and adjust mass of the glass produced to achieve a 20 wt % waste oxide loading
3. LAW glass sodium oxide loading basis is to be 15 wt%

Rev 7-30-96

Assumptions:

HLW glass waste oxide loading basis to be ~20 wt% waste oxides (excluding Na2O and SiO2) following a 1.2 blending factor

sing the WHC engineering data package material balance calculate the waste oxide loading

.. adjust mass of the glass produced to achieve a 20 wt % waste oxide loading

not counting the SiO2 or the Na2O

Sheet A-25
Rev-7-30-96

Assumptions:										
1. Phased Implementation Separations and Treatment is similar to Intermediate Separations										
except the separations for Sr, Tc, and TRU elements are taken from Extensive Separations										
2. HLW glass waste oxide loading basis to be ~20 wt% waste oxides										
not counting the Na2O or SiO2 in the waste feed stream following a 1.2 blend factor										
3. Using the WHC engineering data package material balance calculate the waste oxide loading										
and adjust mass of the glass produced to achieve a 20 wt % waste oxide loading										
4. LAW glass sodium oxide loading basis is to be 15 wt%

Sheet A-37
RCW 7-30-96

Assumptions:										
1. Phased Implementation Separations and Treatment is similar to Intermediate Separations										
except the separations for Sr, Tc, and TRU elements are taken from Extensive Separations										
2. HLW glass waste oxide loading basis to be ~20 wt% waste oxides										
not counting the Na2O or SiO2 in the waste feed stream following a 1.2 blend factor										
3. Using the WHC engineering data package material balance calculate the waste oxide loading										
and adjust mass of the glass produced to achieve a 20 wt % waste oxide loading										
4. LAW glass sodium oxide loading basis is to be 15 wt%

TECHNICAL DATA TO SUPPORT DISPOSAL FEE CALCULATIONS FOR TWRS-EIS

	Outer Diam., m	Length, m	Wall thickness, cm	Nominal Glass Volume, m^3	Total Nominal Weight, kg	Annual Production Rate, # of canisters
DWPF standard canister	0.61	3.00	1.0	0.62	2,200	1,500[1]
TWRS standard canister	0.61	4.50	1.0	1.17	3,700	800[1] 75[2]
TWRS "very large" canister	1.68	5.03	2.5	10.0	29,700	2,200[3]

The total thermal output from all Hanford waste is 930 kW, indexed to December 2021 and assuming that the Cs and Sr capsule inventories are included in the glass. For purposes of evaluating the four (4) scenarios, it should be assumed that the thermal output is uniformly distributed among the number of canisters associated with each scenario, e.g. 1.8 kW per canister for Scenario 3.

The total equivalent Metric Tons Heavy Metal (eMTHM) for all Hanford tank waste is estimated to be 2,600, using the proposed methodology for calculating equivalency that is described in DOE-RL/87-04. For purposes of this exercise, it should be assumed that the eMTHM are uniformly distributed among the number of canisters associated with each scenario, e.g. 4.9 eMTHM per canister for Scenario 3.

[1] For Scenarios 1 and 2, the full-scale (Phase II) production rates are based on an instantaneous melter capacity of 12 MT/day at 60% total operating efficiency.

[2] For Scenario 3, the production rate is based on an instantaneous melter rate of 1 MT/day and a 60% TOE.

[3] For Scenario 4, the full-scale (Phase II) production rate is based on an instantaneous melter rate of 260 MT/day and a 60% TOE.

Sheet A-63
Sensitivity Analysis ADW 7-30-96

Assumptions:										
1. HLW glass waste oxide loading basis to be ~20 wt% waste oxides (excluding Na2O and SiO2) following a 1.2 blending factor										
2. Using the WHC engineering data package material balance calculate the waste oxide loading										
and adjust mass of the glass produced to achieve a 20 wt % waste oxide loading										
3. LAW glass sodium oxide loading basis is to be 15 wt%

Sheet A-141
RDW 7-30-96

3.1.1.2 Schedule for Tank Stabilization. To perform tank stabilization with maximum efficiency and minimum cost, there would be two grout plants. Single-shell tanks and their ancillary equipment would be stabilized first, then DSTs and their ancillary equipment. One grout plant would be located in the center of 200 East Area Tank Farms; the other in the center of the 200 West Area Tank Farms. The following tank clusters would be served:

200E	241-T, 241-TX, and 241-TY 241-S, 241-SX, 241-U, and 241-SY
200W	241-A, 241-AX, 241-AW, 241-AP, 241-AY, and 241-AZ 241-B, 241-BX, 241-BY, 241-C, and 241-AN

3.1.1.3 Engineering Cost for Tank Stabilization. The total tank volume of all SSTs and DSTs is approximately 761,000 m^3 (see Appendix A, Table A1); currently, there are approximately 467,000 m^3 of waste in these tanks. The total tank volume of Tank C-106, which is a 530,000 gal tank, was estimated by computer modeling. The value was compared to the tank capacity, which is the amount of waste the tank contains, and a scaling factor of 1.6 was calculated. This scaling factor was used to estimate the size of all other tanks. In the TWRS-EIS extensive pretreatment, no separations, and Tri-Party Agreement alternatives, it is assumed that 99 percent of the SST waste and 99.9 percent of the DST waste will have been retrieved prior to closure. Therefore, there would be 1,355 m^3 of waste and approximately 760,000 m^3 of void space remaining in the tanks.

For every 1 m^3 (35 ft^3) of grout, the constituents of the grout mixture would be as follows: 1,660 kilograms (kgs) (3,660 pounds [lbs]) of sand, 180 kgs (397 lbs) fly ash, 150 kgs (331 lbs) water, 20 kgs (44 lbs) Type I/II portland cement, and 0.45 kg (1.00 lb) of air entrainment additive. Therefore, for 760,000 m^3 of void space, approximately 1,260,000,000 kgs of sand, 137,000,000 kgs of fly ash, 114,000,000 kgs of water, 15,000,000 kgs of cement, and 341,000 kgs of air entrainment additive would be required.

The major constituent for the grout is sand. Sand would be excavated from Pit 30, located between the 200 East and 200 West Areas. The pit currently has a footprint of 20,930 m^2 (5.2 acres), and would be expanded by another 253,000 m^2 (62.5 acres). A one-way trip is approximately 5 kilometers (km) (3 miles [mi]). A bottom-dump (or belly-dump) truck can haul about 7.6 m^3 (10 cubic yards [yd^3]) of sand. Assuming the sand has a density of about 1,280 kg/m^3, almost 164,000 trips would be required. Cement is manufactured in Durkee, Oregon (approximately 291 km [181 mi] from the Tri-Cities) and would be brought by railcar. Each railcar is assumed to carry 90,700 kgs (100 tons) of cement. For 15,000,000 kgs of cement, 165 railcars would be required. The Centralia Steam Plant in Centralia, Washington, which has a one-way trip of 300 km (186 mi), would provide the fly ash in 90,700 kg (100 ton) railcars. For 137,000,000 kgs of fly ash, 1,510 railcars would be necessary.

To store such large quantities of material, storage tanks or silos would have to be constructed for cement and fly ash. These facilities would keep the dry materials from precipitation and

Sheet A-142
Rev 4-30-96

The success of the filling operation would depend on demonstrating and verifying that required fill distribution and uniformity was achieved. The fill monitoring system would be able to visualize interior tank operations, and a vision system would be able provide imaging through airborne dust. Fill surface elevation measurement and mapping in real time would be available to document the progress of the operation and to verify results. Density and compaction measurement also would be used to verify fill integrity.

3.1.2.3 Engineering Cost for Gravel-Fill Stabilization. The tank waste retrieval process would leave 1 percent waste in the SSTs. The smaller tanks (16 each holding 208 m^3 [55,000 gal]) would be stabilized by grouting rather than gravel fill because they are too small to contain the gravel dispersing mechanism. For this reason, the void volume of the remaining SSTs and DSTs is about 751,000 m^3. This volume of gravel would be removed from Pit 30. The gravel would be transported by end-dump trucks capable of hauling 6 m^3 (10 yd^3) of gravel per trip. Therefore 125,000 trips would be necessary for filling the SSTs and DSTs.

3.2 ANCILLARY EQUIPMENT STABILIZATION

3.2.1 Disposition of Ancillary Equipment

For all alternatives considered in the TWRS EIS except the no disposal action alternative, closure would apply to SSTs, DSTs and the ancillary equipment associated with both groups of tanks. Ancillary equipment would include the following: diversion boxes, catch tanks, valve and pump pits, process pits, diverter stations, receiver vaults, condensate tanks, risers, transfer piping and piping encasements associated with single-shell tank operations. Pipelines would include the following: lines between tanks and to process facilities, air and steam supply lines, raw water lines, and drains. See Figures 3-3 through 3-7 for representative sketches of miscellaneous underground storage tanks.

During closure of tank farms, ancillary equipment items would be stabilized in place (i.e., disposed of). In situ stabilization would consist of filling all voids with an appropriate grout material (a chemical grout or cement grout product). The physical immobilization of contaminants provided by the grout could be augmented by the use of sequestering agents, such as zeolites, that would be capable of chemical bonding with contaminants. If ancillary equipment was plugged at one or more points, several access ports would have to be installed to ensure complete grout filling.

For purposes of assessing the environmental consequences associated with dispositioning of ancillary equipment as part of closure, it is assumed that the entire void volume within the ancillary equipment would be filled with grout (analogous to the grout fill alternative for tanks) and that no ancillary equipment would be excavated, packaged, or disposed of as LLW or mixed waste.

 Sheet A143 Rev 9-30-96

3.2.2 Description of Ancillary Equipment

Ancillary equipment components are defined in the Tri-Party Agreement as *Resource Conservation and Recovery Act* (RCRA) of 1976 (RCRA 1976) past practice units. Appendix A, Table A3 provides a list of the ancillary equipment associated with SSTs (see Appendix C, the Tri-Party Agreement). In 1993, the Tri-Party Agreement signatories agreed that past practice units within tank farms boundaries (fenceline boundaries) would be closed in accordance with the *Washington Administrative Code* (WAC 173-303-610). This decision was based on the intent to establish a consistent closure approach for SSTs and associated RCRA past practice units (i.e., contiguous ancillary equipment and spill sites) to eliminate redundancies in effort, time, and expense.

RCRA past practice units associated with SSTs include piping and control elements for routing waste to a specific tank or from one tank to another. Although the specific arrangement and connections would vary in detail between the various tank farms, all tank farms would be laid out in the same basic arrangement, where one main diversion box would serve several secondary diversion boxes or valve pits which, in turn, would serve three to nine tanks.

Piping consists primarily of welded-joint schedule 40 or 80 carbon steel (a limited amount of schedule 10 was used in the earlier installations). It varied in diameter from 8 to 15 cm (3 to 6 in.). Piping is buried or is within reinforced concrete encasements underground. A limited amount of double-wall pipe (a pipe within a pipe) also was installed. All pipes received one coat of red lead paint during installation. Underground pipe also received two coats of bitumastic paint and was double-wrapped with tar paper. Many pipe runs are equipped with pressure test connections. As many as 10 percent of the pipe runs, particularly the older schedule 10 pipes, are known or suspected to have leaks. Cathodic protection has been incorporated in some piping systems during the past 10 years; the adequacy of existing cathodic protection has not been verified. Some pipelines have been abandoned in place because of plugging.

The pipe encasement system consists of a monolithic reinforced concrete trough and removable reinforced concrete cover. Encasement wall thicknesses are typically 20 to 25 cm (8 to 10 in.), and cavities are minimally-sized to accommodate the installation of piping with the cover removed. Depth of soil cover over the encasements averages 1.8 to 2.4 m (6 to 8 ft). The encasement runs are sloped at about 1 percent to provide catchment of waste leaks or seepage of surface water runoff, and low points drain to a catch tank or pump or sluice pits. With a slope of only 1 percent, it is likely that shallow ponds occur in some sections of encasement. Swab risers at the low points of the encasement are provided to facilitate contamination monitoring.

Diversion boxes are mainly two-or three-chambered underground vaults. Inlet and outlet chambers provide isolated routing space for the intricate maze of inlet and outlet pipes. Waste flow diversion takes place in the central chamber by jumpers and associated valving. Jumpers, flexible or rigid pipes from 0.02-0.1 m (1 -4 in.) in diameter, are connected to the

Sheet A-144
RLW 7-30-96

inlet and outlet pipes at the central chamber bulkheads by dry disconnect couplings. Jumper connections are routinely reconfigured to meet specific waste routing requirements. The central chamber perimeter is equipped with interior spray nozzles to provide a remotely activated surface decontamination wash mechanism. Diversion boxes are reinforced concrete with 0.6 m (2 ft) thick walls and 0.6 (2 ft) thick removable covers at grade level. A gantry crane is deployed over the central chamber to facilitate cover removal and equipment handling. The interiors of the diversion boxes were treated with Americoat, a chemical resistant paint, during construction. In some tank farms, valve boxes were installed instead of diversion boxes, but essential design features and functions are the same.

Liquid waste from underground piping is routed to an individual tank through one or more reinforced concrete pits above the tank, except for some very old tanks with side entry connections. Within these pump and sluice pits, dry disconnect jumpers are used for piping connections to pumps, valves, standpipes, etc. Interior spray nozzles provide decontamination washing of the pits. Drainage is directly into the waste tanks.

Several buried catch tanks provide collection points for liquids draining from diversion boxes and some encasements. The tanks, which are cylindrical in shape and constructed of steel, are accessible for sampling and pumping by standpipes.

Risers are vertical pipes connecting to tank domes. They vary in diameter from 2.5 cm to 107 cm (1-42 in.). Individual single-shell tanks may have as few as 6, or as many as 38 risers. Risers provide access for certain types of tank equipment including instrumentation and pumps. Some of the risers may be modified or removed by waste retrieval operations.

In two tank farms, French drains and septic tanks have been installed to collect and disperse surface water runoff from impervious paving and pads.

3.2.3 Development of Engineering Support Data

Void volumes within the past practice units are the combined volumes of tank farm piping, risers, and pits and encasements. The estimates of ancillary void volumes for the 12 SST tank farms are based on detailed analyses of three tank complexes: 241-A, 241-T, and 241-TY. Volume estimates for other farms are based on similarity to 241-A or 241-T. Void volume data for ancillary equipment are summarized in Appendix A, Figures A9-A13 (Boomer et al. 1993).

Void volumes for ancillary equipment associated with DSTs have been estimated based on similarity to the 241-A tank complexarm. Voids were estimated based on a factor of 28/6 times the 241-A tank complex volume. There are 28 DSTs, six of which are located in the 241-A tank complex. The result of this estimation is a void piping volume of approximately 1,120 m^3 (296,000 gal) and a void structure volume of approximately 6,770 m^3 (1.8 million gal) (Boomer et al. 1993).

Sheet A+145
BQW 7-30-96

Table 5-2A. Comparison of Alternatives by Construction Personnel Requirements for Tank Stabilization with Gravel (Staff Hours).

Construction Personnel	In Situ Disposal	Extensive Pretreatment Option A	Extensive Pretreatment Option B	No Separations	Tri-Party Agreement Preferred Alternative
Design/engineering	n/a	177,000	177,000	177,000	177,000
Construction					
Radiation worker	n/a	65,000	65,000	65,000	65,000
Nonradiation worker	n/a	29,000	29,000	29,000	29,000
Supervisory	n/a	36,000	36,000	36,000	36,000
Total		307,000	307,000	307,000	307,000

Notes:

n/a = not applicable

All staff hours, with the exception of nonradiation construction workers, are based upon the cost estimate by the Westinghouse Hanford Company for gravel fill (March 23, 1993). The cost estimate was computed for a smaller volume of gravel used; therefore, the staff hour values have been scaled to reflect the larger volume of gravel. All workers near the tanks were assumed to be radiation workers (including 1 hopper operator, 1 gravel quality control worker, and 2 belt inspectors); nonradiation workers include the quarry staff (1 loader, 1 grizzley operator, and 2 truck drivers) and one part-time clerical worker (not included in the original estimate, job number 9342GRVL). Maintenance and mechanical support are assumed to be provided by the contractor.

This table includes gravel fill for 133 single-shell tanks (SSTs) and all 28 double-shell tanks. The 16 small SSTs (55,000 gallons each) are not included in these totals as they will be filled with grout rather than gravel.

For additional backup information, see Appendix A, Figure A1 and Table A1 and A2.

Sheet A-146
RDW 7-30-96

Table 5-2C. Comparison of Alternatives by Construction Personnel Requirements for Ancillary Equipment Stabilization by Concrete (Staff Hours).

Construction Personnel	In Situ Disposal	Extensive Pretreatment Option A	Extensive Pretreatment Option B	No Separations	Tri-Party Agreement Preferred Alternative
Design/engineering	n/a	1330	1330	1330	1330
Construction					
Radiation worker	n/a	940	940	940	940
Nonradiation worker	n/a	970	970	970	970
Supervisory	n/a	470	470	470	470
Total		3710	3710	3710	3710

Notes:

Personnel requirements are based on the ratio of the requirements in Table 2B, that is, 36 percent of personnel are involved with design/engineering, 25 percent are radiation workers, 26 percent are nonradiation workers, and 13 percent are supervisors. The actual numbers were derived from a comparison of the volume of void space to be filled in the ancillary equipment to the volume of void space to be filled in the SSTs and DSTs.

The volume of the ancillary equipment for single-shell tanks (SSTs) is in Appendix A. The ratio of these void volumes to the capacity of all SSTs (10,475 m^3)/ (364,331 m^3) = 2.88 percent. It was assumed that the ratio of the ancillary equipment for the double-shell tanks (DSTs) would be the same. Therefore, (2.88 percent)*(111,586 m^3) = 3,208 m^3. Since it takes 17.31 days to stabilize 10,475 m^3 of SST ancillary equipment, it will take 5.3 days to stabilize 3,208 m^3 of DST ancillary equipment.

For additional backup information, see Appendix A, Tables A3-A7.

Table 5-3A. Comparison of Alternatives by Tank Stabilization Construction Resource Requirements (Units as Indicated).

Notes:

ha = hectares
n/a = not applicable
m^3 = cubic meters
GWh = gigawatt hour
t = metric ton

[1]All in situ disposal construction resources are documented in the in situ disposal data package and have not been addressed again in this table.

[2]Land: Permanently committed land is the sum of the barrier areas. The amount of temporarily committed land is used for equipment and materials laydown yards, and was estimated by W. A. Skelly from best engineering judgement. Both of these areas have been expressed in Table 5-3B (Barrier Construction Resource Requirements), and are not repeated here.

[3]Water: The maximum water requirement was assumed to be 50 gallons/yd^2 for barrier construction. The water requirement per barrier is the product of this maximum and the barrier acreage.

[4]Additional major power lines are not required for any of the options.

[5]Diesel fuel: See Appendix A for fuel consumption per day for specified equipment items. This number does not include fuel to run the generator that powers the high efficiency particulate air filter, or fuel to deliver gravel to the site. It only includes the fuel to run one 480 volt, 30 amp generator for the gravel slinger.

[6]Gasoline: Assume 3 light-duty trucks will be used for each barrier; each truck runs 80 miles per day and has an efficiency of 14 miles per gallon. See Tables 5-11 and 5-12 for estimates of barrier schedules; the length of each job was used to calculate the total fuel consumption per barrier.

[7]Excavation: Assumed excavation excludes the removal of material from borrow sites.

[8]Soil: Assumed that soil consists of the upper and lower silt layers of the barrier (layers 1 and 2).

[9]Riprap: Assumed that riprap refers to the basalt layer of the barrier.

[10]Gravel/sand: Assumed this figure is a compilation of all screened aggregate products from Pit 30, including the asphalt base course, the drainage media, and the gravel and sand filter layers of the barrier, as well as the road base.

For additional backup information, see Appendix A, Tables A1-A8.

[3]Additional major power lines are not required for any of the options.

[4]Diesel fuel: See Appendix A for fuel consumption per day for specified equipment items.

[5]Gasoline: Assume 3 light-duty trucks will be used for each barrier; each truck runs 80 miles per day and has an efficiency of 14 miles per gallon. See Tables 5-11 and 5-12 for estimates of barrier schedules. The length of each job was used to calculate the total fuel consumption per barrier.

[6]Excavation: Excludes excavation of material at borrow sites.

[7]Soil: Assumed that soil consists of the upper and lower silt layers of the barrier (layers 1 and 2).

[8]Riprap: Assumed that riprap refers to the basalt layer of the barrier (layer 6).

[9]Gravel/sand: Assumed this figure is a compilation of all screened aggregate products from Pit 30, including the asphalt base course, the drainage media, and the gravel and sand filter layers of the barrier, as well as the road base.

For additional backup information, see Appendix A, Figures A2, A3, and A4; and Tables A8 and A9.

TOTALS:	177			475917		201446400	761467

NOTES: (1) Asterisks following the Tank Farm letter designators mean that the tank is a DST.

(2) The column "FACTOR" refers to a scaling factor determined by the calculation of the actual volume of Tank C-106, 530,000 gallon tank. It was assumed that all tanks had the same geometry as Tank C-106.

The scaling factor comes from the ratio of the calculated C-106 total tank volume (852,000 gallons) divided by the C-106 tank capacity (530,000 gallons). All tank capacities are from the Updated Monthly Hanford Tank Farm Facilities Report (graphics # 29310073.2C).

(3) The total capacity is the amount of waste that actually is in the 177 waste tanks. 1% of the waste in the SSTs will remain in the tanks after retrieval operations; the DSTs are considered to be "clean-closed". That is, no waste remains in the DSTs after retrieval. Therefore, there is actually 760,000 m^3 of void volume in the tanks to be stabilized [761,467 cu m - (0.01)(135,475 cu m of SST capacity)].

TOTALS:	177			242		2139	14973	59.9

NOTE: (1) Double-shelled tanks are designated by an asterisk after the tank farm letter.

(2) The schedule is based upon a maximum depth of 0.91 m (3 ft) per lift of grout, with a curing time of 7 days between lifts. The 55,000 gallon tanks are 25 ft tall and would need 9 lifts, the 530,000 gallon tanks are 28.5 ft tall and would need 10 lifts, the 756,000 gallon tanks are 36 ft tall and would need 12 lifts, the 1,000,000 gallon tanks are 43 ft tall and would need 15 lifts, and the 1,160,000 gallon tanks are 48 ft tall and would need 15 lifts.

(3) The schedule assumes 40 hour workweeks and 250 days per working year.

241-TY*	48.5	397.2	445.7	0.74
241-U	137.4	683.4	820.8	1.36
TOTAL:	1655.5	8819.1	10474.6	17.31

NOTE:

(1) Tank farms which are followed by an asterisk indicate that these void volumes were directly calculated from the preceding tables. All other void volumes were obtained from a scaling factor based on the other tanks' similarities to tanks A and T.

(2) The schedule is derived from the schedule for stabilizing the tanks with grout: the total m^3 of grout volume was divided by the total time for grouting to find a scaling factor. This scaling factor is (761,467 cu m)/(1259.04 days) = 605 cu m/day. All PPU void volumes were divided by this scaling factor to arrive at a preliminary schedule. 10% was added as a contingency factor to the DSTs, in order to compensate for differences in ancillary equipment that may be present.

(3) This schedule assumes 5-day workweeks of 8-hour days.

 Sheet A-158 RDW 7-30-96

The crushed aggregate would be obtained from Pit 30 and delivered to four stockpiles in tank farm areas. Each stockpile would serve the following tank farms:

200E	241-T, 241-TX, and 241-TY 241-S, 241-SX, 241-U, and 241-SY
200W	241-A, 241-AX, 241-AW, 241-AP, 241-AY, and 241-AZ 241-B, 241-BX, 241-BY, 241-C, and 241-AN

Each stockpile would be served by a loader equipped with tires for loading a conveyor network. The network would serve one tank at a time. Because the time to fill a tank a tank is no more than a few operating days, the conveyor runs would be assembled from mobile sections to be repositioned by a crane, as required. After Pit 30 is finished being used for borrow material, it will be filled in until the land is returned to its original contours.

Gravel would be distributed in the tank with a slinger, a mechanism that is suspended in the tank, typically from the center riser. The slinger would capture gravel on a fast-moving horizontal belt, then throw it as it slowly rotated. The belt speed, belt angle, gravel feed rate, and rotational speed would be the primary controlling parameters. A hopper, mounted directly above the slinger, would be fed from the conveyor system and, in turn, would feed the slinger through a quick-acting isolation valve. The valve would not be used to control feed flow to the slinger but would be to isolate the slinger from the ambient environment if tank differential pressure was threatened.

Feed to the hopper would work with the isolation valve. An enclosure, placed around the slinger/hopper assembly, would serve as a confinement buffer not a confinement zone. Conditions could require more than one slinger in a tank. Installed hardware, which could not be removed, might require more than one slinger. The availability of existing risers versus the difficulty of installing new risers also could drive the decision to use more than one slinger. These somewhat smaller slingers could operate like the larger, center-mounted unit. For the purposes of this report, it is assumed that all tanks would use a larger, center-mounted unit. Sacrificial material vibrators could be strategically placed within the tanks to assure maximum fill in critical areas.

3.1.2.2 Special Gravel-Fill Requirements. The heating, ventilating and air conditioning system used must provide sufficient capacity and controls to assure that process operations could not upset the tank pressure differential. Gravel filling would generate a considerable volume of airborne particulates that would have to be separated and removed from the exhaust stream. A series of cyclone separators would be used to remove the particulate from the exhaust before passing through a dual-stage testable HEPA-filter system. Used HEPA filters may be disposed of inside the tanks in order to avoid separate waste disposal costs. There may be other costs associated with such in situ disposal, but they have not been calculated.

 Sheet A-159
RDW - 7-30-96

The success of the filling operation would depend on demonstrating and verifying that required fill distribution and uniformity was achieved. The fill monitoring system would be able to visualize interior tank operations, and a vision system would be able provide imaging through airborne dust. Fill surface elevation measurement and mapping in real time would be available to document the progress of the operation and to verify results. Density and compaction measurement also would be used to verify fill integrity.

3.1.2.3 Engineering Cost for Gravel-Fill Stabilization. The tank waste retrieval process would leave 1 percent waste in the SSTs. The smaller tanks (16 each holding 208 m^3 [55,000 gal]) would be stabilized by grouting rather than gravel fill because they are too small to contain the gravel dispersing mechanism. For this reason, the void volume of the remaining SSTs and DSTs is about 751,000 m^3. This volume of gravel would be removed from Pit 30. The gravel would be transported by end-dump trucks capable of hauling 6 m^3 (10 yd^3) of gravel per trip. Therefore 125,000 trips would be necessary for filling the SSTs and DSTs.

3.2 ANCILLARY EQUIPMENT STABILIZATION

3.2.1 Disposition of Ancillary Equipment

For all alternatives considered in the TWRS EIS except the no disposal action alternative, closure would apply to SSTs, DSTs and the ancillary equipment associated with both groups of tanks. Ancillary equipment would include the following: diversion boxes, catch tanks, valve and pump pits, process pits, diverter stations, receiver vaults, condensate tanks, risers, transfer piping and piping encasements associated with single-shell tank operations. Pipelines would include the following: lines between tanks and to process facilities, air and steam supply lines, raw water lines, and drains. See Figures 3-3 through 3-7 for representative sketches of miscellaneous underground storage tanks.

During closure of tank farms, ancillary equipment items would be stabilized in place (i.e., disposed of). In situ stabilization would consist of filling all voids with an appropriate grout material (a chemical grout or cement grout product). The physical immobilization of contaminants provided by the grout could be augmented by the use of sequestering agents, such as zeolites, that would be capable of chemical bonding with contaminants. If ancillary equipment was plugged at one or more points, several access ports would have to be installed to ensure complete grout filling.

For purposes of assessing the environmental consequences associated with dispositioning of ancillary equipment as part of closure, it is assumed that the entire void volume within the ancillary equipment would be filled with grout (analogous to the grout fill alternative for tanks) and that no ancillary equipment would be excavated, packaged, or disposed of as LLW or mixed waste.

3.2.2 Description of Ancillary Equipment

Ancillary equipment components are defined in the Tri-Party Agreement as *Resource Conservation and Recovery Act* (RCRA) of 1976 (RCRA 1976) past practice units. Appendix A, Table A3 provides a list of the ancillary equipment associated with SSTs (see Appendix C, the Tri-Party Agreement). In 1993, the Tri-Party Agreement signatories agreed that past practice units within tank farms boundaries (fenceline boundaries) would be closed in accordance with the *Washington Administrative Code* (WAC 173-303-610). This decision was based on the intent to establish a consistent closure approach for SSTs and associated RCRA past practice units (i.e., contiguous ancillary equipment and spill sites) to eliminate redundancies in effort, time, and expense.

RCRA past practice units associated with SSTs include piping and control elements for routing waste to a specific tank or from one tank to another. Although the specific arrangement and connections would vary in detail between the various tank farms, all tank farms would be laid out in the same basic arrangement, where one main diversion box would serve several secondary diversion boxes or valve pits which, in turn, would serve three to nine tanks.

Piping consists primarily of welded-joint schedule 40 or 80 carbon steel (a limited amount of schedule 10 was used in the earlier installations). It varied in diameter from 8 to 15 cm (3 to 6 in.). Piping is buried or is within reinforced concrete encasements underground. A limited amount of double-wall pipe (a pipe within a pipe) also was installed. All pipes received one coat of red lead paint during installation. Underground pipe also received two coats of bitumastic paint and was double-wrapped with tar paper. Many pipe runs are equipped with pressure test connections. As many as 10 percent of the pipe runs, particularly the older schedule 10 pipes, are known or suspected to have leaks. Cathodic protection has been incorporated in some piping systems during the past 10 years; the adequacy of existing cathodic protection has not been verified. Some pipelines have been abandoned in place because of plugging.

The pipe encasement system consists of a monolithic reinforced concrete trough and removable reinforced concrete cover. Encasement wall thicknesses are typically 20 to 25 cm (8 to 10 in.), and cavities are minimally-sized to accommodate the installation of piping with the cover removed. Depth of soil cover over the encasements averages 1.8 to 2.4 m (6 to 8 ft). The encasement runs are sloped at about 1 percent to provide catchment of waste leaks or seepage of surface water runoff, and low points drain to a catch tank or pump or sluice pits. With a slope of only 1 percent, it is likely that shallow ponds occur in some sections of encasement. Swab risers at the low points of the encasement are provided to facilitate contamination monitoring.

Diversion boxes are mainly two-or three-chambered underground vaults. Inlet and outlet chambers provide isolated routing space for the intricate maze of inlet and outlet pipes. Waste flow diversion takes place in the central chamber by jumpers and associated valving. Jumpers, flexible or rigid pipes from 0.02-0.1 m (1 -4 in.) in diameter, are connected to the

Sheet 4-166
RDW 7-30-96

inlet and outlet pipes at the central chamber bulkheads by dry disconnect couplings. Jumper connections are routinely reconfigured to meet specific waste routing requirements. The central chamber perimeter is equipped with interior spray nozzles to provide a remotely activated surface decontamination wash mechanism. Diversion boxes are reinforced concrete with 0.6 m (2 ft) thick walls and 0.6 (2 ft) thick removable covers at grade level. A gantry crane is deployed over the central chamber to facilitate cover removal and equipment handling. The interiors of the diversion boxes were treated with Americoat, a chemical resistant paint, during construction. In some tank farms, valve boxes were installed instead of diversion boxes, but essential design features and functions are the same.

Liquid waste from underground piping is routed to an individual tank through one or more reinforced concrete pits above the tank, except for some very old tanks with side entry connections. Within these pump and sluice pits, dry disconnect jumpers are used for piping connections to pumps, valves, standpipes, etc. Interior spray nozzles provide decontamination washing of the pits. Drainage is directly into the waste tanks.

Several buried catch tanks provide collection points for liquids draining from diversion boxes and some encasements. The tanks, which are cylindrical in shape and constructed of steel, are accessible for sampling and pumping by standpipes.

Risers are vertical pipes connecting to tank domes. They vary in diameter from 2.5 cm to 107 cm (1-42 in.). Individual single-shell tanks may have as few as 6, or as many as 38 risers. Risers provide access for certain types of tank equipment including instrumentation and pumps. Some of the risers may be modified or removed by waste retrieval operations.

In two tank farms, French drains and septic tanks have been installed to collect and disperse surface water runoff from impervious paving and pads.

3.2.3 Development of Engineering Support Data

Void volumes within the past practice units are the combined volumes of tank farm piping, risers, and pits and encasements. The estimates of ancillary void volumes for the 12 SST tank farms are based on detailed analyses of three tank complexes: 241-A, 241-T, and 241-TY. Volume estimates for other farms are based on similarity to 241-A or 241-T. Void volume data for ancillary equipment are summarized in Appendix A, Figures A9-A13 (Boomer et al. 1993).

Void volumes for ancillary equipment associated with DSTs have been estimated based on similarity to the 241-A tank complexarm. Voids were estimated based on a factor of 28/6 times the 241-A tank complex volume. There are 28 DSTs, six of which are located in the 241-A tank complex. The result of this estimation is a void piping volume of approximately 1,120 m^3 (296,000 gal) and a void structure volume of approximately 6,770 m^3 (1.8 million gal) (Boomer et al. 1993).
