**SUPPLEMENTAL REMEDIAL INVESTIGATION/ FEASIBILITY STUDY WORK PLAN FOR  
THE 200 AREAS CENTRAL PLATEAU OPERABLE UNITS, DOE/RL-2007-02, DRAFT A,  
VOLUMES I AND II**

The purpose of this letter is to submit the attached Supplemental Remedial Investigation/Feasibility Study Work Plan for the 200 Areas Central Plateau Operable Units, DOE/RL-2007-02, DRAFT A, Volumes I and II for your review and approval.

This transmittal represents completion of Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) Milestone M-013-50 due March 31, 2007. The regulatory review period is scheduled to conclude on May 30, 2007, and we look forward to receiving your comments, on or before that date.

We would like to thank you for your cooperation and assistance in working with the U.S. Department of Energy, Richland Operations Office and its contractors to complete the year-long data quality objectives development process that led to identification of the supplemental characterization needs described in the attached work plan. We sincerely appreciate your contributions to this collaborative effort.

## 1.0 INTRODUCTION

This Supplemental Work Plan consists of two volumes. Volume I contains the work plan, overall sampling and analysis plan (SAP), and summary field activities to be implemented to augment existing data and information for the Central Plateau. Volume II contains the detailed sampling plans for individual waste sites or groups of waste sites to be investigated under this work plan.

The 200 Areas (commonly called the Central Plateau) of the U.S. Department of Energy's (DOE) Hanford Site (Hanford) currently are on the U.S. Environmental Protection Agency's (EPA) National Priorities List (NPL) (40 CFR 300, "National Oil and Hazardous Substances Pollution Contingency Plan," Appendix B, "National Priorities List,"), along with the 100, 300, and 1100 Areas. An NPL site is identified as a site impacted by environmental contamination from industrial waste materials posing real and/or potential threats to human health or the environment. The *Comprehensive Environmental Response, Compensation, and Liability Act of 1980* (CERCLA) and its implementing regulations, 40 CFR 300, "National Oil and Hazardous Substances Pollution Contingency Plan" (NCP), direct the responses, either remedial or removal, for cleanup of NPL sites. These responses to Hanford Site NPL listings are mandated under the *Hanford Federal Facility Agreement and Consent Order*, known as the Tri-Party Agreement (Ecology et al. 1989a, as amended), as directed by the DOE, Richland Operations Office (RL), the EPA, and the Washington State Department of Ecology (Ecology), known as the Tri-Parties.

The CERCLA remedial action process has been identified as the appropriate response action for waste sites on the Central Plateau. These waste sites have been organized into source operable units (OU) for remedial actions, including the investigation and evaluation phases. In addition, the groundwater under the Central Plateau has been organized into separate groundwater OUs. The remedial actions for these groundwater OUs are being investigated and evaluated under a separate CERCLA remedial action process.

One of the first remedial activities is the remedial investigations (RI) phase. As a result of analyzing and evaluating the waste-site RIs performed to date and other existing data from the source OUs on the Central Plateau, the Tri-Parties concluded that supplemental RI data are needed to augment the existing data. The supplemental data are needed to support the evaluation of remedial alternatives, which is conducted during the feasibility study (FS) phase of the remedial action process. This document is an RI/FS supplemental work plan, which, along with the associated SAP (Appendix A), supports the supplemental RI activities that RL, the EPA, and Ecology have determined are necessary to make or augment remedial decisions for waste sites on the Central Plateau of the Hanford Site.

In 1999, the Tri-Parties approved DOE/RL-98-28, *200 Areas Remedial Investigation/ Feasibility Study Implementation Plan – Environmental Restoration Program*. This plan detailed the strategy for a streamlined approach to collecting RI data on the Central Plateau that relied on a process-based grouping of waste sites into OUs. The plan identified

1 the use of RI/FS work plans to focus RI activities on a defined set of representative waste sites.<sup>1</sup>  
 2 Under DOE/RL-98-28, the decisions were to be made on the representative waste sites, thereby  
 3 streamlining and reducing costs for the RIs. Data on analogous sites would be collected  
 4 following the record of decision (ROD) and would be focused on defining the extent of  
 5 contamination, obtaining design data, and confirming that the analogous site conceptual model  
 6 was appropriately represented by the representative waste site.

7 Between 1999 and 2001, RI/FS work plans were developed and approved for the following  
 8 source OUs:

- 9 • **200-CW-1** Gable Mountain Pond/B Pond and Ditches Cooling Water Waste Group  
 10 (DOE/RL-99-07, *200-CW-1 Operable Unit RI/FS Work Plan and 216-B-3 RCRA TSD*  
 11 *Unit Sampling Plan*)
- 12 • **200-CS-1** Chemical Sewer Waste Group (DOE/RL-99-44, *200-CS-1 Operable Unit*  
 13 *RI/FS Work Plan and RCRA TSD Unit Sampling Plan*)
- 14 • **200-TW-1** Scavenged Waste Group/200-TW-2 Tank Waste Group/200-PW-5 Fission  
 15 Product-Rich Waste Group (DOE/RL-2000-38, *200-TW-1 Scavenged Waste Group*  
 16 *Operable Unit and 200-TW-2 Tank Waste Group Operable Unit RI/FS Work Plan*).

17 In 2002, the Tri-Parties conducted a thorough review of the cleanup approach that was being  
 18 applied through DOE/RL-98-28 and identified improvements to accelerate cleanup of these  
 19 waste sites. As part of this improved approach to accelerating waste site cleanup, the Tri-Parties  
 20 agreed to consolidate the 23 process-based source OUs into 12 OU groups based on similarities  
 21 between contaminant sources (Tri-Party Agreement Change Packages M-13-02-01 and  
 22 M-15-02-01, approved in June 2002). To date, RI/FS work plans have been approved for the  
 23 above listed and for the following source OUs or OU groups:

- 24 • **200-CW-5** U Pond/Z-Ditches Cooling Water Waste Group, including 200-CW-2,  
 25 200-CW-4, and 200-SC-1 (DOE/RL-99-66, *Steam Condensate/Cooling Water Waste*  
 26 *Group Operable Units RI/FS Work Plan; Includes: 200-CW-5, 200-CW-2, 200-CW-4,*  
 27 *and 200-SC-1 Operable Units*)
- 28 • **200-PW-2** Uranium-Rich Process Waste Group/200-PW-4 General Process Waste Group  
 29 (DOE/RL-2000-60, *Uranium-Rich/General Process Condensate and Process Waste*  
 30 *Group Operable Units RI/FS Work Plan and RCRA TSD Unit Sampling Plan; Includes*  
 31 *200-PW-2 and 200-PW-4 Operable Units*)

---

<sup>1</sup> Waste sites are combined into groups of sites with similar location, geology, waste-site history, contaminants, etc. Within each group, one or more representative waste sites is selected for comprehensive field investigations, including sampling. Findings from site investigations at representative waste sites then are applied to other waste sites in the waste group that were not characterized. Sites for which field data have not been collected are assumed to have similar or "analogous" characteristics to the site that was characterized. Investigations to confirm the analogous relationships, rather than full characterization, would be performed at the sites not selected as representative.

- 1 • **200-LW-1** 200 Area Chemical Laboratory Waste Group/200-LW-2 300 Area Chemical  
 2 Laboratory Waste Group (DOE/RL-2001-66, *Chemical Laboratory Waste Group*  
 3 *Operable Units RI/FS Work Plan, Includes: 200-LW-1 and 200-LW-2 Operable Units*)
- 4 • **200-MW-1** Miscellaneous Waste Group (DOE/RL-2001-65, *200-MW-1 Miscellaneous*  
 5 *Waste Group Operable Unit RI/FS Work Plan*)
- 6 • **200-PW-1** Plutonium/Organic Rich Process Waste Group/200-PW-3 Organic Rich  
 7 Process Waste Group/200-PW-6 Plutonium Fission Product-Rich Process Waste Group  
 8 (DOE/RL-2001-01, *Plutonium/Organic-Rich Process Condensate/Process Waste Group*  
 9 *Operable Unit RI/FS Work Plan, Includes: 200-PW-1, 200-PW-3, and 200-PW-6*  
 10 *Operable Units*).

11 RL conducted RIs in accordance with the approved work plans. The RIs conducted through  
 12 fiscal year 2006 are summarized in Table 1-1. In addition to the RI data collected under the  
 13 approved work plans, data have been collected under other programs at the Hanford Site. These  
 14 data also are useful in assisting the decision-making process. Data collected during the RIs and  
 15 other programs were reported and evaluated through RI reports and FSs. Proposed plans were  
 16 developed to support public review of the RI/FS process and the proposed remedial alternatives.

17 During the regulatory agency review of the Central Plateau RI reports and FSs, a need for  
 18 additional data above that identified in the approved RI/FS work plans was identified by EPA  
 19 and Ecology in response to stakeholder input. The Tri-Parties undertook a supplemental data  
 20 quality objectives (DQO) process in fiscal years 2005 and 2006 to evaluate data needs and to  
 21 reach agreement on a path forward for supplemental data collection that would augment the RI  
 22 and other data already collected. The elements of the DQO are integrated into this work plan,  
 23 SAP (Appendix A), and other supporting appendices.

24 Table 1-1 provides a summary of the documentation status of Central Plateau waste-site source  
 25 OUs on the environmental remediation pathway.

Table 1-1. Summary of Operable Unit Status. (2 Pages)

Operable Unit	Work Plan	RI Complete?	Remedial Investigation Report	Feasibility Study

200-SW-1/2	DOE/RL-2004-60, Draft A submitted December 2004; Draft B pending	Partially	Not yet issued	Not yet issued

NOTE: This table does not include all the source operable units or the groundwater operable units. Full reference citations for these documents are located in Chapter 7.0.

1 To support the assessment of supplemental data needs, the Tri-Parties grouped waste sites into  
2 seven conceptual model groups (Model Groups 1 through 7 [see Section 2.1 for descriptions of  
3 the model groups]) that are based on risk pathways. These pathways are a function of the type  
4 and location of contaminants within, beneath, and around the waste sites. For example, shallow  
5 sites have different pathways for exposure than do sites with deeper contamination. The model  
6 groups provided a convenient method for determining types and locations of supplemental data  
7 needed to support decision making.

8 One of the conceptual model groups identified, Model Group 1, contains waste sites with  
9 shallow or readily addressed contamination for which the Tri-Parties agreed decision making is  
10 straight forward and supplemental data are not required prior to decision making  
11 (Ecology et. al. 2006, *Hanford Federal Facility Agreement and Consent Order Changes to*  
12 *Central Plateau Waste Site and Groundwater Remediation Milestones [including Tentative*  
13 *Agreement on Negotiations, Introduction, Federal Facilities Agreement and Consent Order*  
14 *Change Control Form M-15-16-02, M-13-06-01, P-11-06-01, C-06-02]). This model group*  
15 includes approximately 350 waste sites (i.e., 40 percent of the total Central Plateau waste sites).

1 These sites are being assigned to two new OUs. Waste sites in Model Group 1 for which  
2 Ecology has authority are now included in the new 200-MG-1 OU; EPA sites are in the new  
3 200-MG-2 OU. A Tri-Party Agreement milestone has been identified in the Change Package for  
4 submittal of an FS for these sites. Therefore, these Model Group 1 waste sites are not included  
5 in the scope of this work plan. The majority of these sites are likely candidates for the removal,  
6 treatment, and disposal (RTD) remedy, the no-action remedy, or the maintain existing soil  
7 cover/monitored natural attenuation/institutional controls (MESC/MNA/IC) remedy. After the  
8 remedy implementation for wastes sites in Model Group 1, further characterization will be  
9 conducted for these waste sites to confirm that agreed-upon cleanup levels have been achieved.  
10 The remaining model groups are discussed later in this work plan (Section 2.2).

11 The need for supplemental data led the Tri-Parties to propose changes to the milestones for  
12 completing the CERCLA RI/FS process for the Central Plateau source OUs  
13 (Ecology et. al. 2006). The proposed milestone changes modify the sequencing for collecting  
14 RI data and for producing the subsequent RI/FS documents leading to remedial decisions. The  
15 proposed milestone changes allow additional time in the RI/FS milestone schedules to support  
16 the supplemental data-collection activities. This approach is intended to provide greater  
17 confidence that cleanup decisions are protective of human health and the environment.

## 18 1.1 PURPOSE AND SCOPE

19 The primary purposes of this document are to (1) identify supplemental data-collection activities  
20 that have been determined by the Tri-Parties to be needed to support completion of the RI/FS  
21 process leading to final RODs for the OUs addressed by this work plan; and (2) to provide RI/FS  
22 work plan- and SAP-level direction for implementing the activities in the field. This RI/FS work  
23 plan provides the strategy for completing the RI/FS process under the proposed Tri-Party  
24 Agreement changes.

25 The scope of the document is to define and implement the supplemental RI for Model Groups 2  
26 through 7, which include waste sites from the following source OU/OU groups:

- 27 • 200-CW-1
- 28 • 200-CW-2, 200-CW-4, 200-CW-5, and 200-SC-1
- 29 • 200-LW-1 and 200-LW-2
- 30 • 200-MW-1
- 31 • 200-PW-1, 200-PW-3, and 200-PW-6
- 32 • 200-PW-2 and 200-PW-4
- 33 • 200-TW-1 and 200-PW-5
- 34 • 200-TW-2.

1 Several other Central Plateau source OUs are not included in the scope of this RI/FS work plan.  
2 These OUs are on separate RI/FS paths as follows.

- 3 • 200-SW-1 and 200-SW-2 – A DQO process is being conducted for this OU to support  
4 revision of an existing Draft A RI/FS work plan (DOE/RL-2004-60, *200-SW-1*  
5 *Nonradioactive Landfills and Dumps Group Operable Unit and 200-SW-2 Radioactive*  
6 *Landfills and Dumps Group Operable Unit Remedial Investigation/Feasibility Study*  
7 *Work Plan*).
- 8 • 200-IS-1 – Similar to 200-SW-1/-2, a DQO is being conducted to support revision of the  
9 existing RI/FS work plan (DOE/RL-2002-14, *Tanks/Lines/Pits/Boxes/Septic Tank and*  
10 *Drain Fields Waste Group Operable Unit RI/FS/Work Plan and RCRA TSD Unit*  
11 *Sampling Plan; Includes 200-IS-1 and 200-ST-1 Operable Units*).
- 12 • 200-BC-1 – This is a new OU that consists of the waste sites in the BC Cribs and  
13 Trenches Area. A treatability test and other activities are planned for this OU to support  
14 completion of the RI/FS process in this area.
- 15 • 200-CW-3 – These waste sites are currently included in the 100/200/300 Areas remaining  
16 sites ROD (EPA/ROD/R10-99/039, *Interim Action Record of Decision, 100-BC-1,*  
17 *100-BC-2, 100-DR-1, 100-DR-2, 100-FR-1, 100-FR-2, 100-HR-1, 100-HR-2, 100-KR-1,*  
18 *100-KR-2, 100-IU-1, 100-IU-6, and 200-CW-3 Operable Units, Hanford Site, Benton*  
19 *County, Washington*) and associated remedial action work plans (RAWP). Planning to  
20 remediate four of these sites is currently underway. The other three 200-CW-3 waste  
21 sites will be remediated in the future. Because the 100/200/300 Areas remaining sites  
22 ROD is considered an interim ROD, the seven 200-CW-3 waste sites will be included in  
23 the 200-MG-2 ROD to obtain the final decision on these sites.
- 24 • 200-CS-1 – These sites have been evaluated in a Draft A FS (DOE/RL-2005-63,  
25 *Feasibility Study for the 200-CS-1 Chemical Sewer Group Operable Unit*), which is  
26 being revised.

27 In addition, the sites included in Model Group 1, the shallow, straightforward remediation sites,  
28 will be assigned to two new Central Plateau source OUs: 200-MG-1 and 200-MG-2. These two  
29 new OUs will include sites from most of the previously identified source OUs. Each of these  
30 new Model Group 1 OUs will be addressed under a separate FS and/or proposed plan and are not  
31 included in the scope of this RI/FS work plan.

## 32 1.2 ORGANIZATION OF WORK PLAN

33 This RI/FS work plan is developed in accordance with EPA guidance (EPA/540/G-89/004,  
34 *Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA,*  
35 *Interim Final, OSWER 9355.3-01*) and with existing approved RI/FS work plans. This  
36 supplemental work plan is presented in two volumes (Volume I and Volume II).

37 Volume I contains the work plan and the supplemental appendices that capture the appropriate  
38 information common to all Central Plateau OUs and waste sites. A key element of Volume I is

1 the overall SAP (Appendix A). This SAP includes a field-sampling plan that provides the  
2 sampling strategy for a range of sampling techniques that could be used to obtain the  
3 supplemental data. This SAP also provides a quality assurance project plan that will be used to  
4 ensure that the data collected meet the appropriate quality assurance and control requirements.  
5 The SAP will support all supplemental sampling activities. Volume I also includes appendices  
6 that:

- 7 • document refinement of applicable or relevant and appropriate requirements (ARAR)  
8 originally identified in DOE-RL-98-28 (see Appendix B)
- 9 • provide results of the DQO activities and summarize the data-collection activities  
10 identified by the Tri-Parties
- 11 • provide the basis for determining analytical detection levels based on ARARs.

12 Volume I is considered a primary document under the Tri-Party Agreement, requiring DOE,  
13 EPA, and Ecology approval.

14 Volume II of this RI/FS work plan is intended to include addenda that contain site-specific  
15 field-sampling plans (SSSP) for each waste site to be investigated. Addendum 1 in Volume II of  
16 Revision 0 of this work plan includes the near-term (approximately the next 2 years)  
17 field-investigation activities. Future addenda to Volume II will be developed to provide SSSPs  
18 for the remaining waste sites to be investigated under this work plan. Each SSSP will be  
19 developed for an individual waste site or group of waste sites under one lead agency. These  
20 SSSPs will contain the detailed sampling strategies, such as number and location of samples,  
21 analytes, and sampling and analytical methods. Each addendum will be considered a primary  
22 document under the Tri-Party Agreement and will require approval from the DOE and the lead  
23 regulatory agency for the OU associated with the waste site or group of waste sites to be  
24 investigated. As the remaining SSSPs are developed and approved to support completion of the  
25 supplemental RI activities, new addenda will be incorporated into Volume II.

26 Table 1-2 summarizes the individual waste sites where the Tri-Parties have identified the need  
27 for supplemental RI and includes the OU, the assigned model group number, the planned  
28 data-collection activities, and the location of the site-specific sampling details for each waste  
29 site.

30 The process associated with this RI/FS work plan is based on Figure 1-1. As supplemental RI  
31 information is gathered, the information is evaluated to determine if it provides sufficient  
32 understanding of the waste-site conceptual model to support decision making. For the majority  
33 of the waste sites and OUs, the supplemental activities identified in Table 1-2 and in Appendix C  
34 are considered sufficient to complete the RI/FS process to reach final RODs. Following  
35 supplemental data-collection activities, the Tri-Parties will review the data. If supplemental data  
36 are considered insufficient to reach a final ROD, then the Tri-Parties will determine the need for  
37 a follow-on DQO to support subsequent sampling.

## 2.0 BACKGROUND AND SETTING

This chapter indicates where geologic setting and general vadose-zone conditions for the Central Plateau have been discussed in other Central Plateau remedial action documents. The Implementation Plan (DOE/RL-98-28) provides preliminary information on the background and setting for the source OUs in the Central Plateau. The subsequent approved RI/FS work plans (see Table 1-1) contain source OU-specific and representative waste-site information on topography, geology, hydrogeology, the vadose zone, groundwater, process history, discharge history, and environmental setting. In addition, other supporting documents present information on the environmental setting and on the ongoing ecological risk assessment efforts for the Central Plateau (see Chapter 7.0, References).

Chapter 2.0 in each of the previously approved RI/FS work plans provides information such as the background and setting for the Central Plateau operations, the processes that discharged waste to the Central Plateau waste sites, geologic and hydrogeologic setting, and groundwater information.

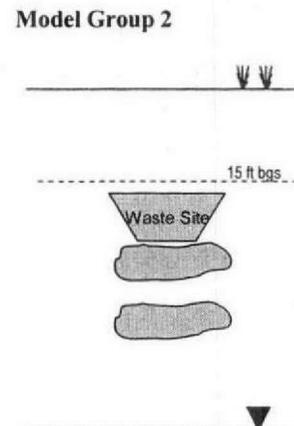

### 2.1 CONCEPTUAL MODEL GROUPS

As indicated in Chapter 1.0, the Tri-Parties undertook an activity in fiscal years 2005 and 2006 to evaluate data needs and to reach agreement on a path forward for supplemental data collection that would augment the data already collected. The initial step in this activity was to bin waste sites, based on an updated understanding gained from the RIs performed under the approved RI/FS work plans, irrespective of their assigned source OUs. The Tri-Parties identified seven bins (i.e., model groups); each bin contained waste sites with similar features regarding contaminant distribution and potential risk pathways. Model Groups 2 through 7 are addressed in this work plan; Model Group 1 is not included, as discussed in Chapter 1.0.

### 2.2 DESCRIPTIONS OF MODEL GROUPS

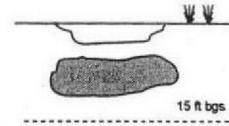

Table 1-2 provides a listing of the waste sites and their associated model groups. Table C-2 in Appendix C provides additional details on the existing information and planned data-collection activities at the individual waste sites. Model Groups 2 through 7 are described in detail as follows (areas of anticipated contamination are highlighted in yellow).

- Model Group 2, Deep Sites (e.g., 216-B-43 through 216-B-50 Cribs, also known as the BY Cribs):** Sites are characterized by deeper contamination (generally below 4.6 m (15 ft) below ground surface [bgs]), as depicted on the right. These sites do not pose risk to human or ecological receptors for the 0 to 4.6 m (15-ft) zone; however, deeper contaminants likely are present and may pose risk to groundwater and potential future intruders.

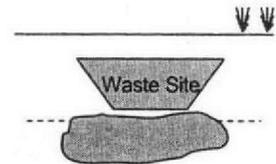

- Model Group 3, Large-Area Plutonium Sites (i.e., Z Ditches):**  
 This group consists of the Z Ditches and associated sites. These sites are characterized as large sites with shallow transuranic contamination (generally less than 4.6 m [15 ft] bgs), as depicted on the right.

Model Group 3

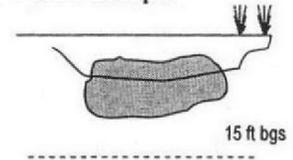

- Model Group 4, Small and Medium Plutonium Sites (e.g., 216-Z-9 Trench, 216-Z-1A Tile Field):** Sites are characterized by transuranic contamination, which tends to be present deeper than in Model Group 3 but much smaller in extent, as depicted on the right. These sites may pose risks to human and/or ecological receptors, risk to groundwater, and risk to potential intruders. A subset of these sites is associated with organic (e.g., carbon tetrachloride) contamination.

Model Group 4

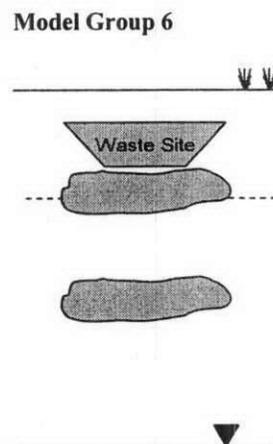

- Model Group 5, Large Ponds (e.g., 216-A-25 Gable Mountain Pond, 216-U-10 U Pond):** This group consists of the large cooling-water ponds that generally are located around the outer perimeter of the 200 Areas. These ponds tend to have shallow, low-concentration contamination, generally associated with the deeper areas of the pond bottoms, as depicted on the right. A supplemental sampling strategy was identified for these sites, as documented in a standalone SAP (DOE/RL-2006-57, *Sampling and Analysis Plan for Supplemental Remedial Investigation Activities at Model Group 5, Large Area Ponds, Waste Sites*). The SAP is included by reference into this RI/FS work plan.

Model Group 5

- 1 • **Model Group 6, Shallow and Deep Sites (e.g., 216-T-14**  
2 **through 216-T-17 Trenches):** Sites are characterized by both  
3 deep and shallow contamination. Site contaminants may pose  
4 risk to human and ecological receptors, potential future  
5 intruders, and the groundwater, as depicted on the right.

- 11 • **Model Group 7, Unique Conceptual Model Sites (e.g., 216-B-5 Reverse Well,**  
12 **200-E-45 Health Instrument Shaft):** This group consists of miscellaneous sites that  
13 have unique conceptual models because of unique construction, waste discharge, or other  
14 characteristics. This model group only contains five waste sites, which the Tri-Parties  
15 believed were unique enough that they did not fit with any of the other model groups.  
16 The waste sites in this model group include three reverse wells, a settling tank, and a  
17 health instrument shaft. The settling tank and instrument shaft are associated with waste  
18 sites from other model groups. The reverse wells discharged effluent deeper in the  
19 vadose zone than other sites, such as cribs or trenches.

This page intentionally left blank.

### 3.0 SUPPLEMENTAL UPDATE TO INITIAL EVALUATION

Under CERCLA, an initial evaluation identifies the waste generating processes, discharge information (such as volumes and inventories), the understanding of the nature and extent of contamination, potential regulatory drivers, potential remedial alternatives, and risk pathways that lead to conceptual site models of the contamination problem being addressed. Initial evaluations are provided for OUs and for associated representative sites in the approved work plans (Table 1-1). For purposes of this work plan, the initial evaluation builds from the approved work plans and provides updates, as necessary, to elements that impact the evaluation of the need for supplemental RIs. The evaluation takes into account the potential ARARs, remedial action objectives (RAO), and potentially viable remedial alternatives. This chapter provides an up-to-date preliminary risk assessment summary for the model groups under supplemental characterization.

#### 3.1 POTENTIAL APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

Potential ARARs are developed during the RI/FS process to ensure that the substantive portions of pertinent environmental regulations are included in the remedial evaluation process. The Implementation Plan (DOE/RL-98-28) provided a starting position for development of potential ARARs for Central Plateau source OUs. Since the Implementation Plan was issued, the current draft FSs have revised those sets of ARARs to reflect the remedial alternatives that may be selected and the conditions that may be encountered when a particular remedial alternative is implemented. The potential ARARs form the basis for determining cleanup levels to which contaminants must be remediated to protect human health and the environment.

For the purposes of this work plan, ARARs have been developed to help in establishing analytical detection limits that are needed to ensure that appropriate cleanup levels can be achieved. These ARARs are a compilation of the pertinent ARARs that have been developed for the individual Central Plateau source OU FSs and are located in Appendix B.

#### 3.2 REMEDIAL ACTION OBJECTIVES

The RAOs are general descriptions of what the remedial action is expected to accomplish (i.e., medium-specific or site-specific goals for protecting human health and the environment). The RAOs are narrative statements, defined as specifically as possible, and usually address the following variables:

- Media of interest (e.g., contaminated soil, solid waste)
- Types of contaminants (e.g., radionuclides, inorganic, organic chemicals)
- Potential receptors (e.g., humans, animals, plants)
- Possible exposure pathways (e.g., external radiation, ingestion).

1 A preliminary set of RAOs has been developed for use in the Central Plateau OU-related  
 2 activities, because waste sites located in the Central Plateau generally have similar future land  
 3 uses, chemical and radiological contamination, exposure pathways and receptors, and media of  
 4 concern. Each source OU FS will develop a specific set of RAOs that will be tailored for  
 5 protection of human health and the environment from the nature and extent of contamination  
 6 from the waste sites. The RAOs to be used for Central Plateau source OUs that are particularly  
 7 pertinent to establishing appropriate cleanup levels (and the associated analytical detection  
 8 levels) are as follows (other RAOs have been identified, but do not lead to development of  
 9 numerical detection limits).

- 10 • RAO 1 – Prevent unacceptable risk to human health and ecological receptors from  
 11 exposure to soils and/or debris contaminated with nonradiological constituents at  
 12 concentrations above the industrial-use criteria, as defined in WAC 173-340-745(5),  
 13 “Soil Cleanup Standards for Industrial Properties,” “Method C Industrial Soil Cleanup  
 14 Levels,” for human health, or the screening criteria in WAC 173-340-7493,  
 15 “Site-Specific Terrestrial Ecological Evaluation Procedures,” for ecological receptors.
- 16 • RAO 2 – Prevent unacceptable risk to human health and ecological receptors from  
 17 exposure to soils and/or debris contaminated with radiological constituents by
  - 18 – Preventing exposure to radiological constituents at concentrations that will cause a  
 19 dose-rate limit of 15 mrem/yr above background for industrial workers  
 20 (EPA/540/R-99/006, *Radiation Risk Assessment At CERCLA Sites: Q & A*,  
 21 Directive 9200.4-31P). A dose-rate limit of 15 mrem/yr above background generally  
 22 achieves the EPA excess lifetime cancer-risk threshold, which ranges from  $1 \times 10^{-6}$  to  
 23  $1 \times 10^{-4}$ .
  - 24 – Protecting ecological receptors, based on a dose-rate limit of 0.1 rad/day for terrestrial  
 25 wildlife populations (DOE-STD-1153-2002, *A Graded Approach for Evaluating*  
 26 *Radiation Doses to Aquatic and Terrestrial Biota*), which is a “to-be-considered”  
 27 criterion.
- 28 • RAO 3<sup>2</sup> – Prevent migration of hazardous chemical contaminants through the soil column  
 29 to groundwater or reduce soil concentrations below WAC 173-340-747, “Deriving Soil  
 30 Concentrations for Ground Water Protection,” groundwater protection criteria so that no  
 31 further degradation of the groundwater results from contaminant leaching from the soil.
- 32 • RAO 4<sup>2</sup> – Prevent migration of radioactive contaminants through the soil column to  
 33 groundwater protection criteria in 40 CFR 141.62, “National Primary Drinking Water  
 34 Regulations,” “Maximum Contaminant Levels for Inorganic Constituents,” so that no  
 35 further degradation of the groundwater results from contaminant leaching from the soil.

---

<sup>2</sup> NOTE: It generally is stated that “Protection of the Columbia River from contaminants is achieved through this remedial action objective. There is no surface water in the immediate vicinity of the waste sites that requires a separate objective.” This will require validation as part of each individual evaluation.

1 Action levels in this work plan are identified for purposes of establishing analytical detection  
 2 limits. The supplemental SAP (Appendix A) includes overall analytical performance tables that  
 3 provide laboratory detection limits, analytical methods, and quality parameters for the composite  
 4 list of Central Plateau constituents. The SSSPs identify the waste-site-specific constituents to be  
 5 analyzed in accordance with these tables.

### 6 3.3 PRELIMINARY LIST OF ALTERNATIVES

7 Preliminary lists of technologies and alternatives were developed and screened in the  
 8 Implementation Plan (DOE/RL-98-28). Subsequently, these lists were reviewed and refined in  
 9 the current versions of the FS documents (see Table 1-1). Based on the technology identification  
 10 and screening, the remedial technologies and process options that were used for development of  
 11 remedial alternatives are summarized in Table 3-1. Likely remedial action alternatives are listed  
 12 in Table 3-2. Sections 3.3.1 through 3.3.7 provide summary descriptions of the likely remedial  
 13 alternatives that will be used for the remediation of the Central Plateau source OUs.

Table 3-1. Process Options and Remedial Technologies. (2 Pages)

General Response Action	Technology Type	Process Option
No Action	No Action	Not Applicable
Institutional Controls	Land-Use Restrictions	Deed Restrictions
	Access Controls	Signs/Fences
		Entry Control
	Monitoring	Ground Water
Air		
	Surface Barriers	Existing Soil Cover
Containment, Including Evapotranspiration Barriers	Surface Barriers	Evapotranspiration Barriers
		Asphalt, Concrete, Cement-Type Cap
		Standard RCRA Caps
	Vertical Barriers	Slurry Walls
		Grout Curtains
		Cryogenic Walls
	Soil Stabilization	Membranes/Sealants/Wind Breaks/Wetting Agents
Removal	Excavation	Conventional
Disposal	Landfill Disposal	Onsite Landfill
		Offsite Landfill/Repository

Alternative 1 – No Action.

Alternative 2 – Maintain Existing Soil Cover, Monitored Natural Attenuation, and Institutional Controls.

Alternative 3 – Removal, Treatment, and Disposal.

Alternative 4 – Partial Removal, Treatment, and Disposal with Engineered Surface Barrier.

Alternative 5 – Partial Removal, Treatment, and Disposal coupled with Institutional Controls and Monitored Natural Attenuation.

Alternative 6 – Engineered Surface Barrier.

Alternative 7 – In Situ Treatment.

### 1 3.3.1 Alternative 1 – No Action

2 The NCP, in 40 CFR 300.430(e)(6), “Remedial Investigation/Feasibility Study and Selection of  
3 Remedy,” “Feasibility Study,” requires that a no-action alternative be evaluated as a baseline for  
4 comparison with other remedial alternatives. The no-action alternative represents a situation  
5 where no legal restrictions, access controls, or active remedial measures are applied to the site.  
6 No action implies “walking away from the waste site” and allowing the wastes to remain in their  
7 current configuration, affected only by natural processes. No maintenance or other activities  
8 would be instituted or continued. Selecting the no-action alternative would require that a waste  
9 site pose no unacceptable threat to human health or the environment.

1 The waste sites addressed in this work plan are expected to require remediation and are not  
2 anticipated to be remediated by the no-action alternative. However, should a site be identified  
3 for remediation by a no-action alternative, a post-ROD DQO will be used to evaluate verification  
4 data needs. Therefore, the supplemental DQO did not focus on identifying data needs for  
5 no-action sites.

### 6 **3.3.2 Alternative 2 – Maintain Existing Soil Cover, 7 Monitored Natural Attenuation, and 8 Institutional Controls**

9 The waste sites addressed in this work plan are expected to have significant contamination and  
10 are not expected to be remediated by this MESC/MNA/IC alternative as a standalone alternative  
11 (elements of this alternative may be used in combination with other alternatives, however).

12 However, if this alternative is determined to be viable for a waste site after supplemental  
13 characterization data have been evaluated, then under this alternative, existing soil covers (clean  
14 backfill over subsurface structures or a surface-stabilization layer of clean soil, or both) would be  
15 maintained and/or augmented as needed to provide protection from intrusion by biological  
16 receptors, along with legal barriers (such as deed restrictions and excavation permits) and  
17 physical barriers (such as fencing) that would mitigate contaminant exposure. Radioactive  
18 contaminants remaining beneath the clean soil cover would be allowed to decay in place  
19 (i.e., attenuate naturally), thereby reducing risk until remediation goals are met.

20 The supplemental DQO process focused on data needs to define the nature of the contamination  
21 in both the near surface and deeper vadose zone soils to support risk analysis and modeling  
22 activities, the vertical and lateral extent of contamination to support the evaluation of protection  
23 of groundwater, and the availability of strongly related existing or proposed supplemental  
24 analogous data to support decision making.

### 25 **3.3.3 Alternative 3 – Removal, Treatment, and 26 Disposal**

27 The sites addressed in this work plan could have contamination extending beyond the viable  
28 excavation depth for an RTD alternative; however, supplemental data may be needed to support  
29 evaluation of this alternative. Sites will be evaluated for a range of remedial alternatives,  
30 including RTD and/or partial RTD alternatives, as appropriate to site conditions. Under this  
31 alternative, structures and soil with contaminant concentrations above the future remediation  
32 goals would be removed, treated as appropriate, and disposed of at an approved disposal facility.

33 The remediation of sites under this RTD alternative would use the observational approach. The  
34 observational approach is a method of planning, designing, and implementing a remedial action  
35 that relies on information (e.g., samples) collected during remediation to guide the direction and  
36 scope of the remediation. Data collected are used to assess the extent of contamination and to  
37 make “real time” decisions in the field. Targeted (or hot-spot) removals could be considered  
38 under this alternative if contamination is localized in only a portion of a waste site.

1 The supplemental DQO process focused on evaluating existing data to identify gaps in the  
2 nature, lateral extent, and vertical extent that are needed to define contaminated volumes and  
3 support modeling of protection of groundwater for this alternative. The observational approach  
4 would be used to fill further data needs as the actual excavation progresses.

#### 5 **3.3.4 Alternative 4 – Partial Removal, Treatment, and** 6 **Disposal with Engineered Surface Barrier**

7 Under this alternative, readily accessible contamination would be removed, treated as  
8 appropriate, and disposed of at an approved facility. An engineered surface barrier would  
9 address protection of groundwater from the remaining contaminants in the vadose zone.  
10 Institutional controls would be included in this alternative. The supplemental DQO process  
11 focused on the nature and extent of near-surface contamination to support the partial removal of  
12 contaminants and the nature and extent of deeper contaminants to support the evaluation and size  
13 of the barrier.

#### 14 **3.3.5 Alternative 5 – Partial Removal, Treatment, and** 15 **Disposal Coupled with Institutional Controls and** 16 **Monitored Natural Attenuation**

17 This alternative uses the partial RTD activities, as discussed in the previous section. However,  
18 remaining contamination is addressed through institutional controls and monitored natural  
19 attenuation rather than an engineered surface barrier. The institutional controls and monitored  
20 natural attenuation are as described in Alternative 2. The supplemental DQO process focused on  
21 the nature and extent of near-surface contamination to support the evaluation of the removal  
22 element and on the nature and extent of deeper contamination to evaluate the institutional  
23 controls/monitored natural attenuation element of this alternative.

#### 24 **3.3.6 Alternative 6 – Engineered Surface Barrier**

25 The engineered surface barrier alternative consists of constructing surface barriers over  
26 contaminated waste sites to control the amount of water infiltrating into contaminated media to  
27 reduce or eliminate leaching of contamination to groundwater. In addition to hydrological  
28 performance, barriers also can function as physical barriers to prevent intrusion by human and  
29 ecological receptors, limit wind and water erosion, and attenuate radiation. Additional elements  
30 to the barrier alternative include institutional controls, discussed earlier, monitored natural  
31 attenuation, and surveillance and maintenance. The supplemental DQO process focused on the  
32 nature and extent of contamination in both the near-surface and deeper vadose zones to support  
33 FS alternative evaluation by providing information on FS-level barrier size and design estimates  
34 and to support modeling and risk assessment.

1 **3.3.7 Alternative 7 – In Situ Treatment**

2 As identified in Table 3-2, several in situ treatment options are applicable, depending on site  
3 conditions. As such, this alternative is not developed to the same extent as the other alternatives.  
4 In general, the in situ treatment will immobilize or remove contaminants within the vadose zone.  
5 Thus, the alternative would reduce or eliminate the potential of exposure or contaminant  
6 migration. Depending on the in situ treatment selected, and the waste-site conditions, it is likely  
7 that institutional controls would be required. The supplemental DQO process focused on the  
8 near-surface nature and extent of contamination to support FS alternative evaluation because  
9 most potentially effective in situ treatment alternatives are depth limited. Additionally, several  
10 other activities are identified in the Tri-Party Agreement change package (Ecology et. al. 2006)  
11 that will deal with deep vadose treatment.

12

## 4.0 WORK PLAN APPROACH AND RATIONALE

The work plan approach and rationale for the initial characterization activities are described in the RI/FS work plans for the individual OUs (see Table 1-1 for a document summary). The approach and rationale for this supplemental work plan builds off of the existing approved work plans, incorporating the desire for supplemental RIs for several of these waste sites. This chapter discusses the supplemental DQO and the overall SAP.

### 4.1 SUPPLEMENTAL DATA QUALITY OBJECTIVES

As previously stated, the Tri-Parties have reevaluated the RI data needs to support remedial decisions in the Central Plateau. Based on a DQO process that evaluated existing waste-site information and identified supplemental data-collection activities for the Model Groups 2 through 7 waste sites, the Tri-Parties have agreed that supplemental RIs should be completed before some cleanup decisions are made. The reasons for the supplemental investigations focused on the following data needs:

- The need to address data gaps, where the relationship between an analogous site and its assigned representative waste site could be strengthened
- The desire to accelerate confirmatory sampling, where obtaining data earlier would reduce uncertainty and better support final decision making
- The need to obtain additional information on the extent of contamination, where data could lead to a different remedy
- The need to obtain additional data to further characterize the deep vadose zone, where recent knowledge and thinking (e.g., groundwater, tank farm, vadose-zone integration, 200-UW-1 OU lessons learned) result in the need for more information.

Conducting a supplemental RI before remedial decision making provides a better understanding of the potential impacts from waste sites to the environment and/or groundwater. This approach is intended to provide greater confidence that remedial decisions are protective of human health and the environment and to reduce uncertainties in the decision-making process.

Following the grouping of the individual Central Plateau waste sites into conceptual model groups, the Tri-Parties initiated focused workshops for Model Groups 2 through 7. The purpose of these workshops was to evaluate the current waste-site knowledge, identify potential data needs, and determine an appropriate sampling strategy for each individual waste site, if needed. These focused workshops were developed in accordance with the EPA's DQO process (EPA/240/B-06/001, *Guidance on Systematic Planning Using the Data Quality Objectives Process*, EPA QA/G-4).

These focused workshops resulted in the identification and concurrence of waste-site-specific supplemental data-collection activities as documented in Appendix C. Appendix C includes two

1 tables: one documenting DQO agreements on the need for supplemental data and one  
2 documenting the site-specific data needs and rationale.

3 During the supplemental investigation DQO process, the Tri-Parties recognized that for certain  
4 waste sites, either existing investigation activities still were under way and/or all of the RI results  
5 were not yet available for review and analysis. For these waste sites, the Tri-Parties agreed that  
6 once the supplemental data are gathered and evaluated, the Tri-Parties will meet to determine if a  
7 follow-on DQO is needed. If it is, separate DQO processes will be conducted to determine what  
8 type of supplemental characterization would be needed. These potential additional DQOs have  
9 been identified and will be included in the project schedule.

#### 10 4.2 SUPPLEMENTAL SAMPLING AND 11 ANALYSIS PLAN

12 Using the results of the supplemental DQO process and building from the existing RI/FS work  
13 plans and associated SAPs (see Table 1-1), a supplemental SAP was developed and is presented  
14 in Appendix A. This SAP provides the general elements for satisfying data needs, including  
15 types of investigative techniques that may be used. The site-specific details are, or will be,  
16 provided in the SSSP Addenda to this Work Plan. This supplemental SAP supports  
17 supplemental RI activities that the Tri-Parties have determined are necessary to make or augment  
18 remedial decisions for waste sites on the Central Plateau. This SAP contains the details for  
19 implementing supplemental data-collection activities in the field. Data collected under this SAP  
20 will be used to support completion of the RI/FS process for these waste sites. In addition,  
21 supplemental RI data may support analyses for other projects, such as Groundwater and Tank  
22 Farms. Conversely, this SAP includes supplemental data that will be obtained from planned  
23 groundwater well-drilling activities. Supplemental RI activities are detailed in the SSSP  
24 Addenda (Volume II) for waste sites in source OUs that have near-term Tri-Party Agreement  
25 milestones to submit FSSs. Subsequent addenda for supplemental RIs can be added at any time  
26 and will require RL and lead-agency approval before implementation. The document  
27 review-and-comment process will follow the requirements set forth in Section 9.2 of the *Hanford*  
28 *Federal Facility Agreement and Consent Order Action Plan* (Ecology et al. 1989b).

29 The supplemental SAP contains three main components:

- 30 • The quality assurance project plan, which establishes quality requirements for the  
31 supplemental investigation activities
- 32 • The field-sampling plan, which describes data-collection activities that may be used to  
33 obtain supplemental data in support of the RI/FS process
- 34 • Volume II addenda, which detail the SSSP for each waste site requiring supplemental  
35 data. Sites identified for near-term supplemental RI activities are included in Revision 0  
36 of Volume II of this RI/FS work plan. SSSPs for the remaining sites will be added to  
37 Volume II, in accordance with this chapter of the RI/FS work plan.

38 To accelerate field implementation of some of the supplemental RI activities, separate SAPs  
39 were prepared ahead of this overall SAP for the following field characterization activities:

1 Model Group 5 waste sites (DOE/RL-2006-57) (see Section 2.1); waste sites 216-A-4 Crib and  
2 200-E-102 Trench (DOE/RL-2006-47, *Sampling and Analysis Plan for Additional Remedial*  
3 *Investigation Activities at the 216-A-4 Crib and the 200-E-102 Trench*); and waste sites  
4 216-A-2 Crib and 216-A-21 Crib (DOE/RL-2006-77, in process, *Sampling and Analysis Plan for*  
5 *Supplemental Remedial Investigation Activities at the 216-A-2 and 216-A-21 Crib*s). The waste  
6 sites covered in these separate SAPs were included in the supplemental DQO process. These  
7 separate SAPs are enforceable under the supplemental work plan.

#### 8 4.3 POST-ROD SAMPLING

9 The RI sampling is one element of the overall remediation-sampling strategy. As remedy  
10 selection decisions are made, additional sampling and analyses activities will be required as  
11 follows.

- 12 • The no-action preferred remedy will require waste-site-specific verification sampling to  
13 ensure that remedial action goals are met.
- 14 • The RTD preferred remedy will require waste-site-specific observational and verification  
15 sampling to ensure that cleanup levels are met.
- 16 • Various preferred remedies (e.g., engineered surface barriers, in situ treatment) may  
17 require waste-site-specific design sampling.
- 18 • Various preferred remedies (e.g., in situ treatment, engineered barriers) will require  
19 operations and maintenance sampling.
- 20 • Confirmatory sampling may be required at analogous sites, where the remedial decision  
21 has been made using data from the representative site, to confirm that the representative  
22 conceptual model is appropriate to the analogous site.

23 While some of the supplemental RI activities represent acceleration of post-ROD confirmatory  
24 sampling, additional confirmatory sampling may be necessary at sites not initially identified for  
25 supplemental data collection.

This page intentionally left blank.

## 5.0 REMEDIAL INVESTIGATION PROCESS

The purpose of this chapter is to describe the role of the supplemental RI in the overall Central Plateau source OU RI/FS process (Figure 5-1). Additionally, this chapter describes the completion of the RI/FS process through integration of the existing information and RI data with the supplemental RI data, leading to final RODs for these Central Plateau source OUs.

Figure 5-1 shows the RI/FS process for the Central Plateau source OUs, both the historical activities leading to the determination that supplemental RIs were needed, and the path forward for completing the RI/FS and decision process that incorporates the supplemental data.

Chapter 1.0 discusses the Central Plateau source OU RI/FS process to date, beginning with the Implementation Plan (DOE/RL-98-28) and proceeding through RI field work and reporting and current versions of FSs. As described previously (Chapter 1.0), after a review of existing information, the Tri-Parties determined that additional data were needed to reduce uncertainty in decision making.

The supplemental DQO (Chapter 4.0) was performed using the conceptual model groups to identify data needs. However, the remainder of the RI/FS process and the decision making for the waste sites will occur as part of their assigned source OUs, as defined in Ecology et al. 2006. This means that the FSs will be prepared on an OU basis in accordance with their associated milestones.

### 5.1 SUPPLEMENTAL REMEDIAL INVESTIGATION

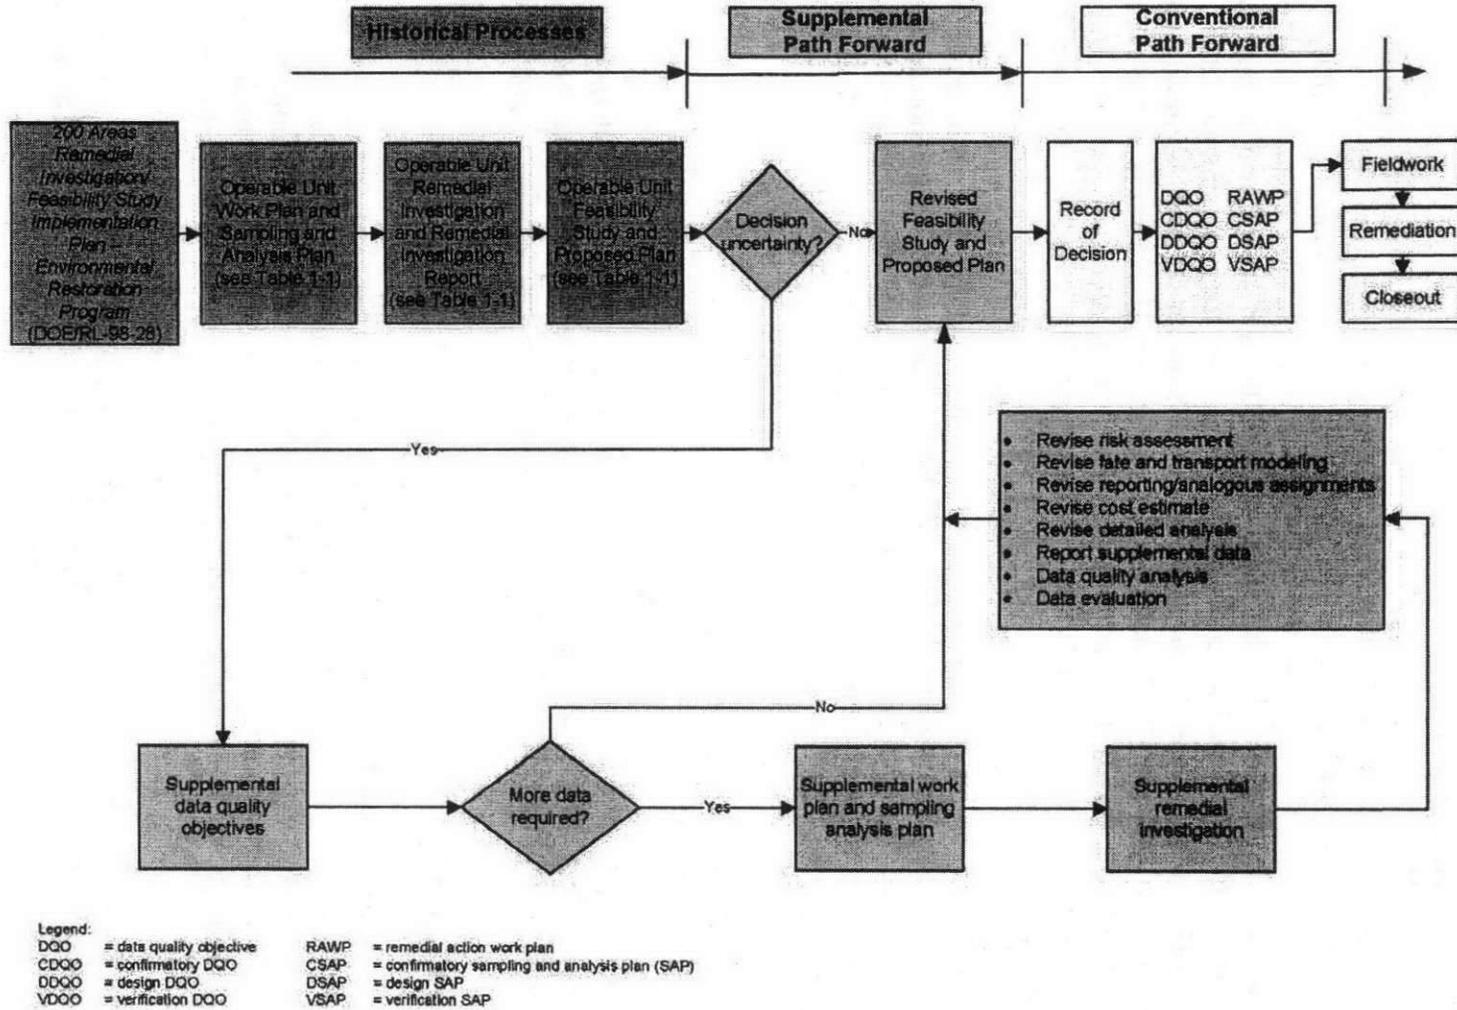

The planned supplemental RI activities that will be conducted in accordance with the SAP (Appendix A) and SSSPs (Volume II) are discussed in the following subsections. The associated supplemental RIs will include field planning, field investigation, and sample analysis/validation.

#### 5.1.1 Field Planning

Field planning includes compiling, refining, and/or preparing the necessary documentation to accomplish field activities. These activities include excavation permits, waste designation DQOs summary reports, waste control plans, site-specific health and safety plans, preliminary hazard classifications, and other supporting documents. Some of these documents will be newly generated for each waste site or group of waste sites, while others will be updated from existing documents.

Waste designation DQOs have been completed to support the initial RI activities. As needed, based on differing constituents, the existing waste designation DQOs will be used as is or revised appropriately to support the supplemental RI activities.

Figure 5-1. Supplemental Remedial Investigation/Feasibility Study Process.

5-2

1 Waste generated during the RI will be managed in accordance with existing, revised, or new  
2 waste control plans. Waste control plans have been prepared for each of the OUs with approved  
3 work plans. Depending on the supplemental RI activities to be performed, the existing waste  
4 control plans will be used as is or revised appropriately. If no existing waste control plan is  
5 available, new plans will be prepared.

6 Worker safety is discussed briefly in the supplemental SAP (Appendix A) and will be addressed  
7 further in site-specific health and safety plans that will be prepared for all field activities.

### 8 **5.1.2 Field Investigations**

9 The field investigation task involves data-gathering activities performed in the field that are  
10 required to satisfy identified site-specific supplemental data needs from the DQO. The  
11 supplemental RI approach is summarized in Chapter 4.0, with additional details provided in the  
12 supplemental SAP and the SSSPs. The near-term scope, as identified in Volume II, Addenda 1  
13 and the separate SAPs for 216-A-4, 200-E-102, 216-A-2, 216-A-21, and Model Group 5,  
14 includes shallow and deep boreholes, drive points, test pits, geophysical logging, and surface  
15 geophysical methods (e.g., high-resolution resistivity). (The overall scope, including longer term  
16 scope, is identified in Appendix C. Details will be added as additional addenda to Volume II.)  
17 Additional data-collection methods may be used depending on site conditions, data needs, and  
18 availability of technologies. The overall SAP is written to encompass other potential  
19 investigative techniques.

20 As the field investigations are completed, field reports will be prepared for each waste site or  
21 group of waste sites to summarize the activities performed and the information collected in the  
22 field. The report will include survey data for borehole locations, the number and types of  
23 samples collected, inventory of investigation-derived waste containers, geological logs,  
24 field-screening results, and geophysical-logging results.

### 25 **5.1.3 Sampling Analysis/Validation**

26 Samples collected from the supplemental RI activities will be analyzed for the site-specific  
27 analytes of interest and for select physical properties, based on the detailed sampling strategies in  
28 the SSSPs. Additional sampling, analysis, and validation details are presented in the overall SAP  
29 and SSSPs.

## 30 **5.2 FEASIBILITY-STUDY PROCESS**

31 The FS process identified in this section includes activities to support the preparation or revision  
32 of FSs for the Central Plateau source OUs. These activities include supplemental data reporting  
33 and overall data evaluation and preparation of FSs. The Tri-Parties agreed that the supplemental  
34 data will be included in the OU FSs as opposed to revising the RI reports to capture revisions in  
35 evaluation of nature and extent of contamination, risk assessment, and modeling.

## 1 5.2.1 Data Reporting and Evaluation

2 This section summarizes data reporting and data evaluation leading to the production of the FS.

### 3 5.2.1.1 Data Quality Assessment

4 A data quality assessment of the supplemental RI data will be performed in accordance with  
5 EPA/240/B-06/002, *Data Quality Assessment: A Reviewers Guide*, EPA QA/G-9R, to determine  
6 if the data are the right type, quality, and quantity to support the intended use. The supplemental  
7 data quality assessment completes the data life cycle of planning, implementation, and  
8 assessment that began with the identification of data needs. For this task, the data will be  
9 examined to determine if they meet the analytical quality criteria outlined in the SAP/SSSP and  
10 to determine if the data are adequate to support decision making for the source OUs.

### 11 5.2.1.2 Data Evaluation

12 Data evaluation includes integrating supplemental and existing data, compiling data to support  
13 risk assessment and modeling activities, and assessing data to evaluate the nature and extent of  
14 contamination and further refine the conceptual model.

15 Risk assessments and modeling have been conducted throughout the RI/FS process and will be  
16 updated and refined as necessary to incorporate the supplemental data.

## 17 5.2.2 Feasibility Studies

18 For several source OU groups, Draft A FSs have been submitted to the regulatory agencies, as  
19 identified in Table 1-1. Because the Tri-Parties have determined the need for supplemental data,  
20 these FSs will be reevaluated based on the results of supplemental data and in accordance with  
21 the Tri-Party Agreement milestones to provide information to support final decisions on  
22 the OUs.

23 The FS tasks include assessment of analogous site assignments; refinement of potential ARARs,  
24 RAOs, and preliminary remediation goals; refinement of technology screening; refinement of  
25 alternative screening; and detailed and comparative analysis of alternatives. The FSs will be  
26 prepared using the existing OU groupings as defined in Ecology et al. 2006.

27 The assessment of analogous sites originally was conducted in the existing FSs. Supplemental  
28 data will be incorporated into this assessment, and analogous site assignments will be refined  
29 accordingly. In several cases, sites may be reassigned to analogous sites where supplemental  
30 data collection is planned, because these analogous sites with supplemental data represent a  
31 better analysis fit than the original representative waste sites.

32 Potential ARARs, RAOs, and preliminary remediation goals have been defined through the  
33 Implementation Plan (DOE/RL-98-28) and refined in the existing OU FSs. Potential ARARs  
34 and RAOs are included in Chapter 3.0 and Appendix B to support the selection of appropriate  
35 analytical detection levels. In the FSs, potential ARARs, RAOs, and preliminary remediation  
36 goals will be refined to support alternative evaluation and the remedial decision-making process.

1 Technologies were preliminarily identified and screened in the Implementation Plan. Similarly,  
2 alternatives were preliminarily developed and screened in the Implementation Plan refinement  
3 through the FS process, which has resulted in screening of a broader list of technologies and a  
4 broader range of remedial alternatives in some of the existing FSs. A summary of the broader  
5 technology and remedial alternative lists is included in Chapter 3.0. Going forward, the FSs will  
6 include further refinement of the technology screening and alternative development tasks, based  
7 on the results of the integration of the existing and supplemental data.

8 Remedial alternatives will be reevaluated against the nine CERCLA criteria  
9 (40 CFR 300.430(e)(9)(iii), "Remedial Investigation/Feasibility Study and Selection of  
10 Remedy," "Feasibility Study"), based on the results of integration of the existing RI and other  
11 information and the supplemental RI information, including refinement of volume and cost  
12 estimates. The results of this reevaluation will be documented in the revised and/or new FS  
13 documents in accordance with the Tri-Party Agreement milestones established in the Tri-Party  
14 Agreement change package; the results also will be summarized in the associated Central Plateau  
15 source OU proposed plans.

### 16 5.3 TREATABILITY STUDIES

17 No treatability studies currently are planned as part of this supplemental RI work plan.  
18 However, treatability studies have been identified through Ecology et al. 2006 to investigate  
19 deep vadose-zone remedial technologies and waste-site excavation techniques. Information from  
20 these treatability studies may be used to support the detailed analysis of remedial alternatives in  
21 the FS as appropriate to the OU conditions (see Table 6-1 for milestones that have been  
22 identified for treatability studies). The treatability tests will provide information on  
23 effectiveness, implementability, and cost for groundwater protection techniques and on  
24 excavation risks and costs.

### 25 5.4 REMEDY SELECTION, RECORD OF 26 DECISION, AND POST-RECORD OF 27 DECISION ACTIVITIES

28 This section identifies the remedy selection, ROD, and post-ROD activities.

#### 29 5.4.1 Remedy Selection and Record of Decision

30 Once the FS process for remedial alternative evaluation for a Central Plateau OU has been  
31 completed, a proposed plan will be developed that contains a summary of the key elements of the  
32 FS and presents the recommended selected final remedies for the OU. This proposed plan will  
33 undergo a public review and comment process (40 CFR 300.430(f)(3), "Remedial  
34 Investigation/Feasibility Study and Selection of Remedy," "Selection of Remedy"). After the  
35 public-comment period has been completed, a ROD will be prepared (40 CFR 300.430(f)(5)) that  
36 documents the final remedial action decisions for the OU and the responses to the public  
7 comments.

1 **5.4.2 Post-Record of Decision Activities**

2 After the ROD is issued, a remedial design report (RDR) and RAWP will be prepared to detail  
3 the scope of the remedial action. The RDR/RAWP will include an integrated schedule of  
4 remedial activities for the OUs. Following the completion of the remedial activities, verification  
5 activities will be performed as specified in the ROD and the RDR/RAWP.

6 Post-ROD activities will include the preparation of SAPs, using the DQO process for  
7 confirmatory sampling to confirm that the proposed remedial action for an analogous waste site  
8 is appropriate; for design sampling to complete final designs of remedial alternatives; and for  
9 verification sampling to demonstrate that the appropriate remedial action goals have been  
10 achieved.

11 Fieldwork to implement the post-ROD SAPs and remediation of the waste site will follow the  
12 schedule as outlined in the RDR/RAWP. An operations and maintenance plan will be prepared  
13 for implemented remedies that, while still protective of human health and the environment, leave  
14 contamination in place. Finally, final closeout reports will be prepared to document that all of  
15 the remedial activities for the OU have been implemented in accordance with the approved  
16 CERCLA documents.

17

## 6.0 PROJECT SCHEDULE

The project schedule for activities discussed in this RI/FS work plan is shown in Figure 6-1. This schedule will serve as the baseline for the work planning process and will be used to measure the progress of the implementation of this process. These dates are consistent with and support Tri-Party Agreement Major Milestone M-15-00C for completion of all non-tank farm 200 Areas pre-ROD waste-site investigations, under approved RI/FS work plan schedules, by December 31, 2011. A Class II change form will be submitted to Ecology and EPA to request the change or addition of any interim milestones. Any updates to the project schedule or associated milestones will be reflected in the annual work-planning process and are not anticipated to require a revision to this RI/FS work plan. Field activity initiation is planned for fiscal year 2007, under DOE/RL-2006-47, DOE/RL-2006-57, and DOE/RL-2006-77. Field work and associated SSSPs for the other waste sites will follow Tri-Party approval of this RI/FS work plan in accordance with the schedule in Figure 6-1.

Table 6-1 provides a summary of the Tri-Party Agreement milestones for the Central Plateau source OUs.

Table 6-1. Summary of Tri-Party Agreement Central Plateau Milestones by Source Operable Unit. (2 Pages)

Operable Unit	Milestone Number	Milestone Summary	Milestone Due Date
General	M-013-50	Submit to Ecology and EPA one RI/FS work plan for all supplemental characterization required for 200 Area OUs.	03/31/2007
General	M-015-00C	Complete all 200 Area non-tank farm OU site investigations under approved work plan schedules through submittal of feasibility study reports and a recommended remedy(ies).	12/31/2011
200-CW-1 200-CW-3 200 North	M-015-38B	Submit a revised feasibility study report and revised proposed plans for 200-CW-1 to Ecology.	05/31/2009
200-CW-2 200-CW-4 200-CW-5 200-SC-1	M-015-40D	Submit a revised feasibility study report and revised proposed plan for 200-CW-2, 200-CW-4, 200-CW-5, and 200-SC-1 OUs to EPA.	04/30/2008
200-LW-1 200-LW-2	M-015-46B	Submit a feasibility study report and the recommended remedy for 200-LW-1 and 200-LW-2 OUs to Ecology.	12/31/2011
200-MW-1	M-015-44B	Submit the 200-MW-1 OU feasibility study report and proposed plan to EPA.	12/31/2008
200-PW-1 200-PW-3 200-PW-6	M-015-45B	Submit the feasibility study report and the proposed plan for 200-PW-1, 200-PW-3, and 200-PW-6 OUs to EPA.	09/30/2007
200-PW-2 200-PW-4	M-015-43D	Submit the feasibility study report and the revised recommended remedy(ies) for 200-PW-2 and 200-PW-4 OUs to Ecology.	12/31/2010

Table 6-1. Summary of Tri-Party Agreement Central Plateau Milestones by Source Operable Unit. (2 Pages)

Operable Unit	Milestone Number	Milestone Summary	Milestone Due Date
200-TW-1 200-TW-2 200-PW-5	M-013-51	Submit an addendum to the 200-TW-1/2 PW-5 OU Group RI/FS work plan for a treatability test at the 200 BC Cribs and Trenches to EPA. The remedial investigation information shall be incorporated into a revised feasibility study report and a revised proposed plan for the 200 BC Cribs and Trenches.	12/31/2006 (submitted on schedule)
200-TW-1 200-PW-5	M-015-42D	Submit a revised feasibility study report and revised proposed plan for 200-TW-1 and 200-PW-5 OUs to EPA.	12/31/2011
200-TW-2	M-015-42E	Submit a revised feasibility study report and revised recommended remedy(ies) for 200-TW-2 OU to Ecology.	12/31/2011
General	M-015-50	Submit a Treatability Test Work Plan for Deep Vadose Zone Technetium and Uranium to Ecology and EPA.	12/31/2007

Ecology = Washington State Department of Ecology.

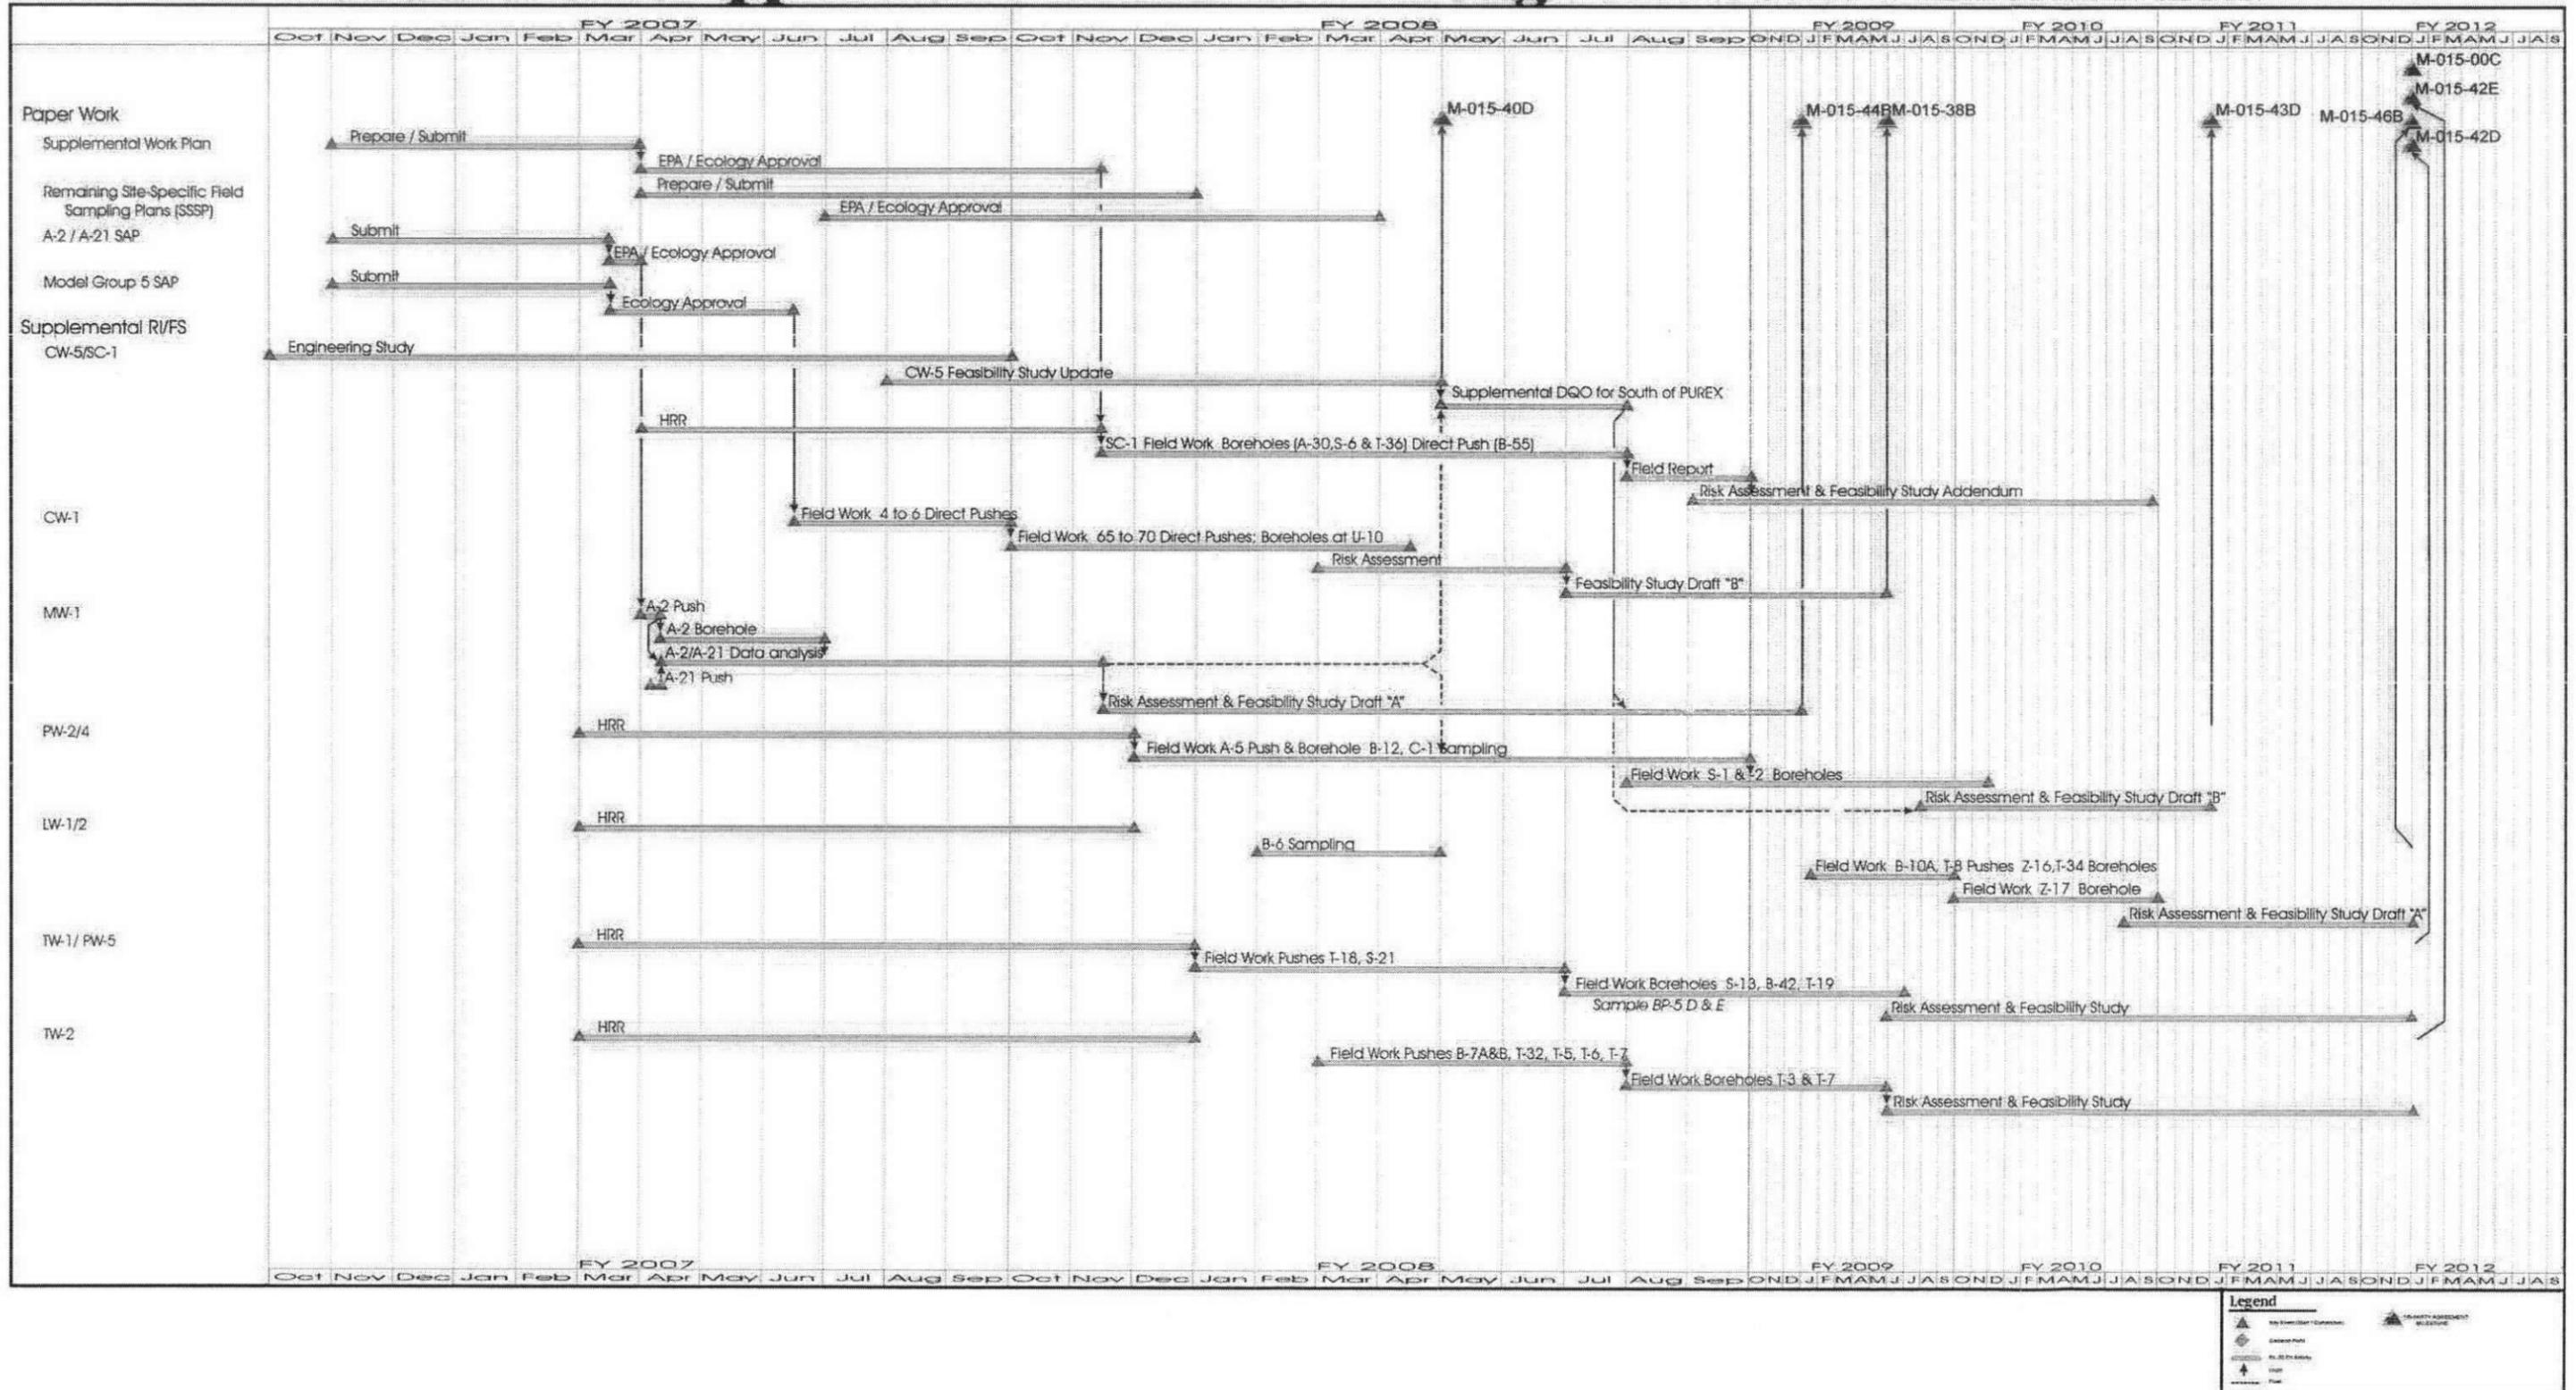

EPA = U.S. Environmental Protection Agency.

OU = operable unit.

RI/FS = remedial investigation/feasibility study.

## APPENDIX A

## OVERALL SAMPLING AND ANALYSIS PLAN

## A1.0 INTRODUCTION

This Sampling and Analysis Plan (SAP) supports supplemental remedial investigation (RI) activities directed by the Supplemental Work Plan. The U.S. Department of Energy, Richland Operations Office (RL), U.S. Environmental Protection Agency (EPA), and the Washington State Department of Ecology (Ecology) have determined in a data quality objective (DQO) process that these activities are necessary to make or augment remedial decisions for waste sites on the Central Plateau of the Hanford Site. The DQO results are integrated into the Supplemental Work Plan, overall SAP, and the associated addenda, which include site-specific data-collecting activities. The Work Plan presents scope, background, rationale, and framework for conducting supplemental RIs. The SAP contains the details for implementing these supplemental data-collection activities in the field. This SAP is consistent with EPA guidance and builds from the existing work plans (Volume 1, Table 1-1).

The SAP presents an overall sampling strategy for a range of sampling techniques that could be used at individual waste sites to obtain supplemental data and includes the following:

- The quality assurance project plan (QAPjP), which establishes quality requirements for the supplemental investigation activities
- The field-sampling plan (FSP), which describes data-collection activities that may be used to obtain supplemental data in support of the RI/feasibility study (FS) process
- Volume 2 Addenda, which detail the site-specific field-sampling plan (SSSP) for each waste site requiring supplemental data. Sites identified for near-term supplemental RI activities are included in Revision 0 of Volume 2 of this Work Plan. SSSPs for the remaining sites will be added to Volume 2 in accordance with Chapter 4.0 of the Work Plan.

To accelerate field implementation of some of the supplemental RI activities, separate SAPs were prepared ahead of this SAP. Model Group 5, large area ponds waste sites are investigated under DOE/RL-2006-57, *Sampling and Analysis Plan for Supplemental Remedial Investigation Activities at Model Group-5, Large Area Ponds, Waste Sites*. The 216-A-4 Crib and 200-E-102 Trench are investigated under DOE/RL-2006-47, *Sampling and Analysis Plan for Additional Remedial Investigation Activities at the 216-A-4 Crib and the 200-E-102 Trench*. The 216-A-2 and 216-A-21 Crib will be investigated under a SAP currently in preparation. These SAPs remain enforceable under the Supplemental Work Plan. The results of these separate SAP RI activities will be incorporated into the process described in Volume I, Figure 5-1.

## A2.0 QUALITY ASSURANCE PROJECT PLAN

2 The QAPjP establishes the quality requirements for environmental data collection, including  
3 sampling, field measurements, and laboratory analysis. The QAPjP has been updated from the  
4 QAPjPs in the approved RI/FS Work Plans because of changes in RL contractor and associated  
5 documentation. This QAPjP complies with the requirements of the following:

- 6     • DOE O 414.1C, *Quality Assurance*
- 7     • 10 CFR 830 Subpart A, "Quality Assurance Requirements"
- 8     • EPA/240/B-01/003, *EPA Requirements for Quality Assurance Project Plans*,  
9       EPA QA/R-5, as amended.

10 The following sections describe the quality requirements and controls applicable to the  
11 supplemental RI.

### 12 A2.1 PROJECT MANAGEMENT

13 This section addresses the basic areas of project management, and describes how project  
14 management will ensure that the project has a defined goal, that the participants understand the  
15 goal and approach to be used, and that the planned outputs have been appropriately documented.

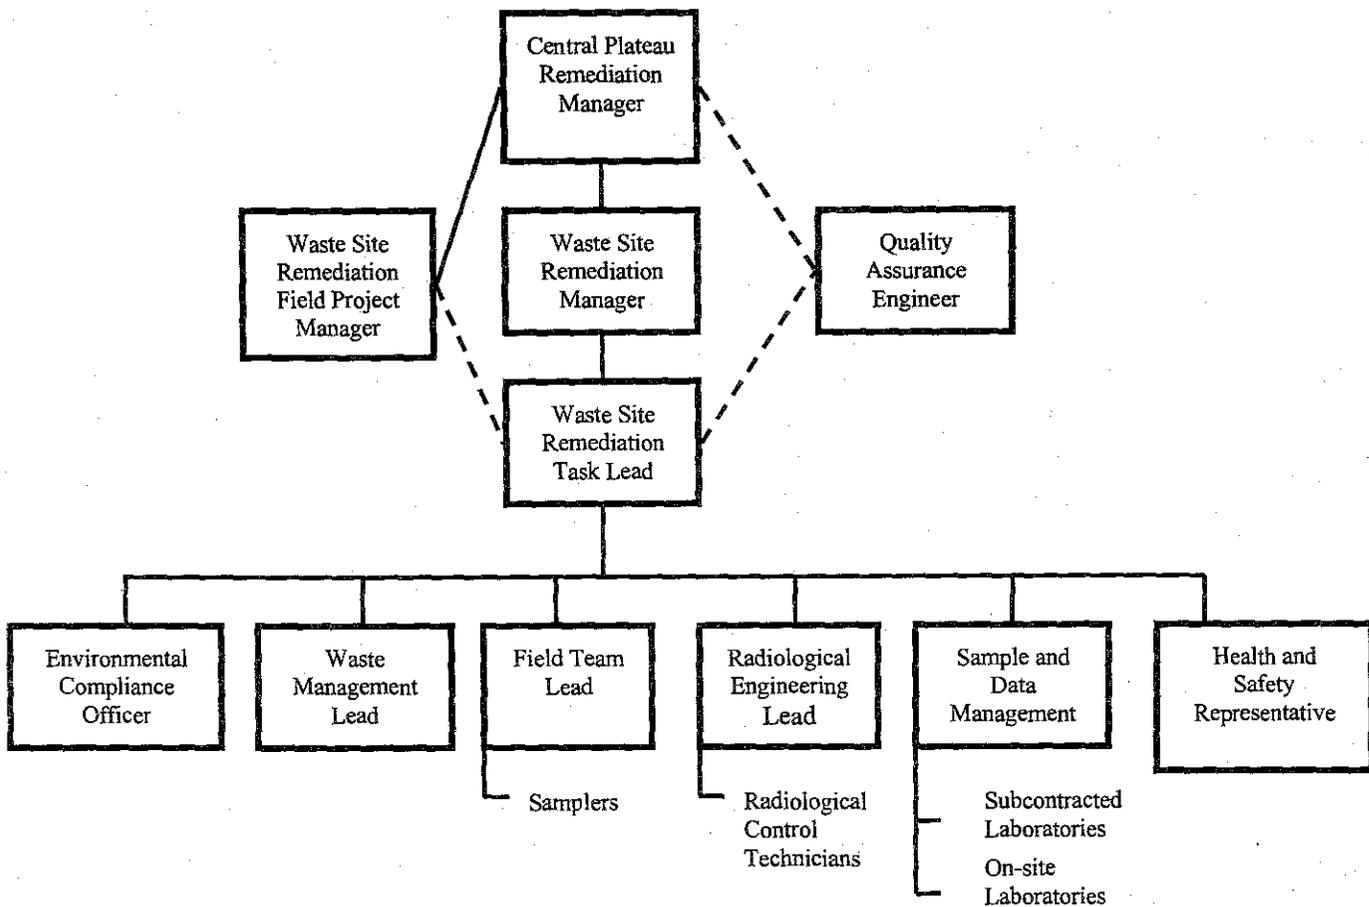

#### 16 A2.1.1 Project/Task Organization

17 The Project Hanford Management Contractor is responsible for planning, coordinating,  
18 sampling, preparing, packaging, and shipping soil samples to the laboratory. The project  
19 organization is described in the subsections that follow and is shown graphically in Figure A2-1.

##### 20 A2.1.1.1 Central Plateau Remediation Manager

21 The Central Plateau Remediation Manager has overall authority over the work scope in this  
22 Work Plan and SAP; the Manager provides project-level oversight and coordinates with RL and  
23 the regulators in support of Central Plateau remediation activities, including sampling activities.  
24 The Central Plateau Remediation Manager interfaces with the Groundwater Remediation Vice  
25 President and the Project Hanford Management Contractor Senior Vice President and President.  
26 The Central Plateau Remediation Manager provides support to the Waste Site Remediation  
27 Manager to ensure that the work is performed safely and cost effectively.

1 Figure A2-1. Project Organization.

2

3 **A2.1.1.2 Waste Site Remediation Manager**

4 The Waste Site Remediation Manager provides oversight for all activities and coordinates with  
 5 the Central Plateau Remediation Manager, RL, and the regulators in support of sampling  
 6 activities. In addition, the manager provides support to the Waste Site Remediation Task Lead to  
 7 ensure that the work is performed safely and cost-effectively.

8 **A2.1.1.3 Waste Site Remediation Task Lead**

9 The Waste Site Remediation Task Lead is responsible for direct management of sampling  
 10 documents and requirements, field activities, and subcontracted tasks. The task lead works  
 11 closely with quality assurance (QA), health and safety, and the Field Team Lead to integrate  
 12 these and the other lead disciplines in planning and implementing the work scope. The task lead  
 13 also coordinates with, and reports to, RL and the Project Hanford Management Contractor on all  
 14 sampling activities. The task lead supports RL in coordinating sampling activities with the  
 15 regulators. The Waste Site Remediation Task Lead maintains the approved QAPjP.

**A2.1.1.4 Waste Site Remediation Field Project Manager**

2 The Waste Site Remediation Field Project Manager is responsible for coordinating field support  
3 resources and activities for the Waste Site Remediation Task Lead. The Field Project Manager  
4 ensures that field documentation is approved and properly implemented and that management is  
5 statused on daily activities. The Field Project Manager coordinates obtaining equipment,  
6 personnel, and site support and has real-time direction of field activities and field decisions that  
7 affect sampling. The Field Project Manager has real-time responsibility for ensuring the QAPjP  
8 and SAP are followed in the field.

**A2.1.1.5 Quality Assurance Engineer**

10 The Quality Assurance Engineer is matrixed to the Central Remediation Manager and the Waste  
11 Site Remediation Task Lead and is responsible for QA issues on the project. Responsibilities  
12 include oversight of project QA requirements implementation, review of project documents  
13 including SAPs (and the QAPjP), and participation in QA assessments on sample collection and  
14 analysis activities, as appropriate.

**A2.1.1.6 Waste Management Lead**

16 The Waste Management Lead communicates policies and procedures and ensures project  
17 compliance for storage, transportation, disposal, and waste tracking in a safe and cost-effective  
18 manner. Other responsibilities include identifying waste management sampling/characterization  
19 requirements to ensure regulatory compliance interpretation of the characterization data to  
20 generate waste designations, profiles, and other documents that confirm compliance with waste  
21 acceptance criteria.

**A2.1.1.7 Environmental Compliance Officer**

23 The Environmental Compliance Officer provides technical oversight, direction, and acceptance  
24 of project and subcontracted environmental work and develops appropriate mitigation measures  
25 with a goal of minimizing adverse environmental impacts. The Environmental Compliance  
26 Officer also reviews plans, procedures, and technical documents to ensure that all environmental  
27 requirements have been addressed, identifies environmental issues that affect operations and  
28 develops cost-effective solutions, and responds to environmental/regulatory issues or concerns  
29 raised by the DOE and/or regulatory staff.

**A2.1.1.8 Field Team Lead**

31 The Field Team Lead has the overall responsibility for the planning, coordination, and execution  
32 of the field characterization activities. Specific responsibilities include converting the sampling  
33 design requirements into field task instructions that provide specific direction for field activities.  
34 Responsibilities also include directing training, mock-ups, and practice sessions with field  
35 personnel to ensure that the sampling design is understood and can be performed as specified.  
36 The Field Team Lead communicates with the Waste Site Remediation Task Lead to identify field  
37 constraints that could affect the sampling design. In addition, the Field Team Lead directs the  
38 procurement and installation of sampling materials and equipment needed to support  
39 the fieldwork.

1 The Field Team Lead oversees field-sampling activities that include sample collection,  
2 packaging, provision of certified clean sampling bottles/containers, and documentation of  
3 sampling activities in controlled logbooks, chain-of-custody documentation, and packaging and  
4 transportation of samples to the laboratory or shipping center. The samplers collect all samples,  
5 including replicates/duplicates, and prepares all sample blanks according to the SAP and  
6 corresponding standard procedures and work packages.

7 The Field Team Lead, samplers, and others responsible for implementation of this SAP and  
8 QAPjP will be provided with current copies of this document and any revisions thereto by the  
9 Waste Site Remediation Task Lead.

#### 10 **A2.1.1.9 Radiological Engineering Lead**

11 The Radiological Engineering Lead is responsible for the radiological engineering and health  
12 physics support to the project. Specific responsibilities include conducting as-low-as-  
13 reasonably-achievable (ALARA) reviews, exposure and release modeling, and radiological  
14 controls optimization for all work planning. In addition, radiological hazards are identified and  
15 appropriate controls are implemented to maintain worker exposures to the hazards ALARA. The  
16 Radiological Engineering Lead interfaces with the project Health and Safety representative and  
17 plans and directs radiological control technician support for all activities.

#### 18 **A2.1.1.10 Sample and Data Management**

19 The Sample and Data Management organization selects the laboratories that perform the  
20 analyses. This organization also ensures that the laboratories conform to Hanford Site internal  
21 laboratory QA requirements, or their equivalent, as approved by RL, EPA, and Ecology. Sample  
22 and Data Management receives the analytical data from the laboratories, makes the data entry  
23 into the *Hanford Environmental Information System* database (HEIS), and arranges for data  
24 validation. Validation will be performed on completed data packages by Project Hanford  
25 Management Contractor personnel or by an independent contractor qualified to perform  
26 validation by meeting the requirements of applicable site procedures.

#### 27 **A2.1.1.11 Health and Safety Representative**

28 Responsibilities include coordination of industrial health and safety support to the project as  
29 carried out through health and safety plans, activity job hazard analyses, and other pertinent  
30 safety documents required by Federal regulation or by internal Project Hanford Management  
31 Contractor work requirements. In addition, assistance is provided to project personnel in  
32 complying with applicable health and safety standards and requirements. Personal protective  
33 clothing requirements are coordinated with Radiological Engineering.

#### 34 **A2.1.2 Problem Definition/Background**

35 The problem being addressed by this SAP is the need for supplemental investigation data for the  
36 Central Plateau waste sites. These supplemental data will augment existing RI data leading to  
37 completion of the RI/FS process for the Central Plateau operable units (OU) addressed in the  
38 Work Plan. Additional details on the problem definition and background are provided in

Chapter 1.0 of the Work Plan. In addition, supplemental RI data may support analyses for other projects, such as Groundwater and Tank Farms.

### A2.1.3 Project/Task Description

The overall Central Plateau Waste Site project description is to complete the RI/FS process for Central Plateau OUs. This SAP is directed at a subset of OUs and associated waste sites where the need for supplemental data has been identified by the DOE, EPA, and Ecology (the Tri-Parties). As identified in the site-specific addenda, a combination of intrusive data-collection techniques, such as deep boreholes, shallow boreholes, direct-push holes, and test pits, will be used to collect samples of vadose zone media for analysis. These analyses will include identifying radiological and nonradiological contamination and physical properties to aid in the understanding of the nature and extent of contamination at the waste sites. Non-intrusive activities, such as downhole geophysical logging and high-resolution resistivity (HRR) surveys, will be used to augment the intrusive data-collection activities.

This SAP and the associated addenda lay out the plan to complete supplemental data-collection activities. The supplemental data will be incorporated into FSs to support *Hanford Federal Facility Agreement and Consent Order* (Ecology et al. 1989a) (Tri-Party Agreement) major Milestone M-015-00C for completion of the RI/FS processes for the Central Plateau OUs by December 31, 2011. Chapter 6.0 of the Work Plan provides a schedule of the interim milestones for the OUs leading to the major milestone.

### A2.1.4 Quality Objectives and Criteria for Measurement Data

The QA objective of this plan is to develop implementation guidance to data-collection activities that will provide data of known and appropriate quality. Data quality is assessed by data quality indicators, by evaluation against identified DQOs, and by evaluation against the work activities identified in the existing work plans, and this Supplemental Work Plan and SAP. The applicable quality control (QC) guidelines and quantitative target limits for assessing data quality are dictated by the intended use of the data and the nature of the analytical method. The following subsections identify the contaminants of potential concern (COPC) and their respective preliminary action levels in support of establishing analytical requirements, including analytical method target limits. The quantitative and qualitative data quality indicators are also described below.

#### A2.1.4.1 Development of Contaminants of Potential Concern and Preliminary Action Levels for Establishment of Analytical Requirements

This section identifies the 200 Areas Central Plateau waste-site COPCs and identifies the process for development of their corresponding preliminary action levels in support of establishing appropriate analytical requirements. The analytical performance requirements, including required detection limits, are contained in Tables A2-1 and A2-2.

#### 1 A2.1.4.1.1 Development of Contaminants of Potential Concern

2 The COPCs for the 200 Areas Central Plateau waste sites to be investigated under this SAP were  
3 developed on an OU basis using information about historical Central Plateau operations, the  
4 results of characterization activities, and the DQO processes documented in the respective OU  
5 work plans (Volume I, Table 1-1). The comprehensive list of COPCs is identified on an OU  
6 basis in Table A2-3. Unless otherwise noted, the COPCs for the OU within which a waste site  
7 resides will apply to the waste site being sampled.

8 Based on additional historical research into crib discharges, Ni-63 and Sm-151 also have been  
9 identified as COPCs. No analytical method was identified for Sm-151, but concentrations can be  
10 estimated based on decay relationships with other radiological constituents.

#### 11 A2.1.4.1.2 Development of Preliminary Action Levels

12 Preliminary action levels represent regulatory- or risk-based soil concentrations of  
13 nonradionuclide or radioactive constituents that are considered protective of human health,  
14 ecological receptors, and groundwater and could be used by the FS process to meet remedial  
15 action objectives. Identification of preliminary action levels is helpful in demonstrating that the  
16 analytical detection limits required of the laboratories will provide laboratory data that can be  
17 compared to final action levels and so is usable in making remedial decisions. Consequently,  
18 such levels should be detectable by laboratory analytical processes to ensure that data are useable  
19 in making remedial decisions. Use of preliminary action levels provides a technical basis for  
20 establishing analytical requirements found in Tables A2-1 and A2-2 for the COPCs identified in  
21 Table A2-3. The overall process identifies preliminary action levels that could be used as final  
22 action levels for protection of human health, ecological receptors, and groundwater at 200 Areas  
23 Central Plateau waste sites and then compares these levels to available Hanford Site soil  
24 background values to ensure that required detection limits do not exceed such levels and that the  
25 data are usable.

26 **Nonradionuclide preliminary action levels.** The preliminary action levels for human health,  
27 ecological receptors, and groundwater protection from exposure to nonradioactive chemical  
28 constituents listed in Table A2-2 were derived as follows.

- 29 • Preliminary action levels for nonradionuclide COPCs in shallow soils that are protective  
30 of human health from direct exposure are risk-based numeric levels expressed in terms of  
31 concentration (mg/kg) based on an industrial land-use scenario. Risk-based standards for  
32 industrial land use for carcinogenic and noncarcinogenic COPCs were calculated for  
33 shallow soils (the top 4.6 m [15 ft] of the soil column) using the Method C formulas of  
34 WAC 173-340-745, "Soil Cleanup Standards for Industrial Properties," or, Method A,  
35 WAC 173-340-900, "Tables," Table 745-1, for industrial sites, as applicable (e.g., lead).
- 36 • Preliminary action levels for nonradionuclide COPCs that are protective of terrestrial  
37 ecological receptors in shallow soils of industrial properties are derived from simplified  
38 terrestrial ecological evaluation procedures provided in WAC 173-340-7492, "Simplified  
39 Terrestrial Ecological Evaluation Procedures," and the Wildlife column of Table 749-3 in  
40 WAC 173-340-900.

- Preliminary action levels for nonradionuclide COPCs in deep soil (i.e., greater than 4.6 m [15 ft] deep) that are protective of groundwater were calculated using the fixed parameter three-phase partitioning model (Equation 746-1 of WAC 173-340-747(4), "Deriving Soil Concentrations for Ground Water Protection," "Fixed Parameter Three-Phase Partitioning Model").

**Radionuclide preliminary action levels.** The preliminary action levels for human health, ecological receptors, and groundwater protection from exposure to radionuclides listed in Table A2-1 were derived as follows.

- Preliminary action levels for radionuclides that are protective of human health from direct exposure to radionuclides in shallow soils of industrial properties were developed using the RESidual RADioactivity (RESRAD) model Version 6.3 (ANL 2005, *RESRAD for Windows*). These levels correspond to an operational direct-exposure dose rate guideline of 15 mrem/yr above background that equates to an achievement of a  $10^{-4}$  to  $10^{-6}$  carcinogenic risk range in accordance with EPA/540/R-99/006, *Radiation Risk Assessment At CERCLA Sites and Q & A*, Directive 9200.4-31P.
- Preliminary action levels for radionuclides in shallow soils that are protective of ecological receptors at industrial properties were obtained from the RESRAD-Biota model Version 1.2 and are Level 1 (screening level) values (ANL 2006, *RESRAD-Biota*) and the terrestrial radionuclide screening levels presented in DOE-STD-1153-2002, *A Graded Approach for Evaluating Radiation Doses to Aquatic and Terrestrial Biota*.
- Preliminary action levels for individual radionuclides in deep soil that are protective of groundwater will be developed using STOMP (PNNL-12034, *STOMP, Subsurface Transport Over Multiple Phases, Version 2.0, User's Guide*) modeling; hence the groundwater action levels are listed as TBD (to be determined).

#### A2.1.4.2 Quantitative Analytical Parameters

The quantitative analytical parameters of precision and accuracy as described in the following sections will apply to analytical data analysis.

##### A2.1.4.2.1 Accuracy

Accuracy is an assessment of the closeness of the measured value to the true value. Accuracy of chemical test results is assessed through several standard methods. These methods include calibrating measurement systems using standards of known concentration (calibration); analyzing solutions known to contain no analytes of interest to verify that the sample processing and preparation process do not affect the measurement (blank analyses); routinely analyzing samples containing known concentrations of analyte(s) of interest (laboratory control sample analysis); and, spiking samples with known standards and establishing the average recovery (matrix spike analysis). Radionuclide measurements that require chemical separations use the matrix spike technique to measure method performance. For radionuclide measurements that are analyzed by gamma spectroscopy, laboratories typically compare results of blind audit samples against known standards to establish accuracy. Validity of calibrations is evaluated by

1 comparing results from the measurement of a standard to known values and/or by generating  
2 in-house statistical limits based on three standard deviations (+/ 3 SD). Tables A2-1, A2-2, and  
3 A2-4 list the accuracy requirements for fixed laboratory analyses for the project.

4 An additional element of the accuracy objective is measurement method sensitivity, frequently  
5 described by the minimum detectable concentration, also referred to as the detection limit. The  
6 detection limit reflects the smallest concentration of an analyte that can be reliably measured in a  
7 sample and must be established to provide data at concentrations low enough for comparison  
8 against remedial action levels and remediation goals established during the RI/FS planning  
9 process. Detection limits are functions of the analytical method used to provide the data and the  
10 quantity of the sample available for analyses. Detection limits identified for the analytes for the  
11 soil and QC samples are listed in Tables A2-1 and A2-2 (see Required Detection Limits columns  
12 on the tables). The preliminary action levels are estimates of potential cleanup levels and are  
13 used in this SAP to ensure that detection limits are established to provide laboratory data at low  
14 enough concentrations to assess potential action limits during the feasibility study, where  
15 potential applicable or relevant and appropriate requirements are identified. Required detection  
16 limits are generally lower than the preliminary action levels so that any nondetect laboratory  
17 results can be used to demonstrate that the field concentrations do not, in fact, exceed target  
18 action levels. The detection limits presented in the tables are typical for clean media and  
19 trace-level analysis and should be achievable by a laboratory in the absence of interferences. A  
20 laboratory analyzing samples displaying more than trace level contamination may not be able to  
21 achieve these detection limits.

22 The general objective for detection limits is to establish a minimum detectable concentration that  
23 is below the action level to prevent generation of inconclusive data. The detection limits for the  
24 soil and QC sample analytes identified for this RI are listed in Tables A2-1, A2-2, and A2-4 as  
25 required detection limits and are generally lower than the preliminary action level to ensure that  
26 the data are useable.

#### 27 **A2.1.4.2.2 Precision**

28 Precision is a measure of the data spread when more than one measurement has been taken on  
29 the same sample. Precision is assessed through analysis of multiple aliquots of the same sample  
30 in the laboratory (laboratory replicate analysis), through analysis of split samples prepared in the  
31 field and submitted to the laboratory as separate samples (field duplicate analysis), and through  
32 assessment of multiple analyses of laboratory control samples. Precision is typically expressed  
33 as the relative percent difference for duplicate measurements. Analytical precision requirements  
34 for fixed laboratory analyses are listed in Tables A2-1, A2-2, and A2-4. These are typical  
35 precision levels that a laboratory should be able to achieve on project liquid and solid samples.  
36 Inability to achieve the precision requirements is an indicator that there is a problem with the  
37 sampling process, analytical system, or sample matrix and requires further investigation.

#### 38 **A2.1.4.2.3 Completeness**

39 Completeness is a measure of the amount of valid data needed to be obtained from a  
40 measurement system. This parameter compares the number of valid measurements completed to  
41 the minimum number of samples to be collected and analyzed to establish

2 description/measurement of the system at a minimum confidence with those established by the  
3 project's quality criteria (DQOs or performance/acceptance criteria).

4 For this supplemental RI activity, the overall objective for completeness is 85 percent from all  
5 measurement techniques. The uncertain nature of subsurface sampling may result in limited  
6 sample returns and completeness objectives may not be met. Mitigating activities can include  
7 prioritization of the analyte list or sending minimum volumes for analysis. Impacts from these  
8 activities will be assessed in the data quality assessment (DQA).

#### 8 **A2.1.4.3 Qualitative Analytical Parameters**

9 Qualitative analytical parameters identified in this section include representativeness and  
10 comparability. The degree to which these qualitative parameters will apply to collection of  
11 supplemental data at individual sites will be identified in the site-specific addenda. These  
12 parameters are described below.

##### 13 **A2.1.4.3.1 Representativeness**

14 Representativeness refers to the degree to which a data set actually describes a sample of a  
15 population (e.g., the information presented by the data set can be extrapolated to describe the  
16 overall site or system). The measurements of a data set must be evaluated to determine whether  
17 the data are collected in such a manner that they represent the environment or condition being  
18 measured or studied (i.e., the actual concentration and distribution of the radiological  
19 constituents in the matrix sampled). Representativeness should be assessed on a gross (i.e., site  
20 or system) level and on an individual measurement level to ensure that the data user understands  
21 how the data set can be used to describe the target system. Sampling plan design, sampling  
22 techniques, and sample handling protocols (e.g., storage, preservation, transportation) have been  
23 developed and are discussed in subsequent sections of this document. Representativeness of the  
24 data set will be evaluated during the DQA.

##### 25 **A2.1.4.3.2 Comparability**

26 Comparability is an expressed measure of confidence that one data set can be compared to  
27 previous and subsequent measurements and so can be combined for purposes of decision  
28 making. This parameter compares sample collection and handling methods, sample preparation  
29 and analytical procedures, holding times, stability issues, and QA protocols. Data comparability  
30 will be maintained using standard procedures, consistent methods, and consistent units.  
31 Tables A2-1, A2-2, and A2-4 list applicable fixed-laboratory methods for analytes and target  
32 detection limits.

#### 33 **A2.1.5 Special Training/Certification Requirements**

34 A graded approach is used to ensure that workers receive a level of training that is commensurate  
35 with their responsibilities and that complies with applicable DOE orders and government  
36 regulations. The Field Team Lead, in coordination with line management, will ensure that all  
37 field personnel meet all special training requirements.

1 Typical training requirements or qualifications have been instituted by the primary contractor  
2 management team to meet training requirements imposed by the Project Hanford Management  
3 Contract (DE-AC06-96RL13200, *Contract Between the U.S. Department of Energy, Richland*  
4 *Operations Office, and Fluor Hanford, Inc.*), regulations, DOE orders, DOE contractor  
5 requirements documents, American National Standards Institute/American Society of  
6 Mechanical Engineers, *Washington Administrative Code*, etc. For example, the environmental,  
7 safety and health training program provides workers with the knowledge and skills necessary to  
8 safely execute assigned duties. Field personnel typically will have completed the following  
9 training before starting work:

- 10 • Occupational Safety and Health Administration 40-hour hazardous waste worker training  
11 and supervised 24-hour hazardous waste-site experience
- 12 • 8-hour hazardous waste worker refresher training (as required)
- 13 • Hanford general employee radiation training
- 14 • Hanford general employee training
- 15 • Radiological worker training.

16 Project specific training includes the following.

- 17 • Training requirements or qualifications needed by sampling personnel will be in  
18 accordance with QA requirements.
- 19 • Samplers are required to have training and/or experience in the type of sampling that is  
20 being performed in the field (e.g., borehole sampling).
- 21 • Qualification requirements for radiological control technicians are established by the  
22 Radiation Protection Program; radiological control technicians assigned to these activities  
23 will be qualified through the prescribed training program and will undergo ongoing  
24 training and qualification activities.

25 Project-specific safety training, geared specifically to the project and the day's activity, will be  
26 provided. Pre-job briefings will be performed to evaluate an activity and its hazards by  
27 considering many factors including the following:

- 28 • Objective of the activities
- 29 • Individual tasks to be performed
- 30 • Hazards associated with the planned tasks
- 31 • Controls applied to mitigate the hazards
- 32 • The environment in which the job will be performed
- 33 • The facility where the job will be performed
- 34 • The equipment and material required
- 35 • The safety procedures applicable to the job
- 36 • The training requirements for individuals assigned to perform the work

- The level of management control
- The proximity of emergency contacts.

Training records are recorded for each individual in an electronic training record database. The Fluor Hanford training organization maintains the training records system. Line management will confirm that an individual employee's training is appropriate and up-to-date prior to performing any fieldwork.

#### A2.1.6 Documentation and Records

The Waste Site Remediation Task Lead is responsible for ensuring that the current version of the SAP is being used and for providing any updates to field personnel. Version control is maintained by the administrative document control process. Minor changes to the FSP and/or SSSP, such as location changes with depth due to sample recovery or obstructions, may be made in the field by the Waste Site Remediation Field Project Manager and Task Lead. Changes to the FSP and/or SSSP that affect the DQOs, such as overall borehole location or sampling method, will be reviewed and approved by RL and Ecology prior to implementation; this approval may be through actual revision of the Work Plan and/or SAP documents or may be documented through Unit Manager Meeting minutes under the Tri-Party Agreement. The Waste Site Remediation Task Lead and Field Project Manager are responsible for ensuring that the field instructions are maintained up to date and aligned with any revisions to the SAP. As appropriate, the document revision process will follow the requirements set forth in Section 9.3 of the *Hanford Federal Facility Agreement and Consent Order Action Plan* (Ecology et al. 1989b).

The project file will include the following, as appropriate:

- Field logbooks or operational records
- Global Positioning System data
- Chain-of-custody forms
- Sample receipt records
- Inspection or assessment reports and corrective action reports
- Interim progress reports
- Final reports.

The Waste Site Remediation Task Lead is responsible for ensuring that the data file is properly maintained. The project files will contain the records or references to their storage locations.

The laboratory is responsible for maintaining and having available upon request:

- Analytical logbooks
- Raw data and QC sample records
- Standard reference material and/or proficiency test sample data
- Instrument calibration information.

Records may be stored in either electronic or hard copy format. Documentation and records, regardless of medium or format, are controlled in accordance with internal work requirements

1 and processes that ensure accuracy and retrievability of stored records. Records required by the  
2 Tri-Party Agreement will be managed in accordance with the requirements of the Agreement.

### 3 **A2.2 MEASUREMENT/DATA ACQUISITION**

4 This section presents the requirements for sampling methods, sample handling and custody,  
5 analytical methods, and field and laboratory QC. Instrument calibration, maintenance supply  
6 inspection, and data management requirements also are addressed.

#### 7 **A2.2.1 Sampling Process Design**

8 The sampling process design describes the data-collection design for the project, including types  
9 and numbers of samples required, sampling locations and frequency, sample matrices, and the  
10 rationale for the design. The approved work plans (Table 1-1) describe the sampling process  
11 designs based on DQOs and sampling strategies for the initial RI work. Following review of the  
12 initial RI data, the Tri-Parties agreed to assess the need for supplemental data through a  
13 supplemental DQO process. A major effort in the supplemental DQO process was the  
14 Tri-Parties' review of the existing data for each waste site to determine if gaps existed that would  
15 influence the decision process. Data gap analysis focused on the following:

- 16 • The need to address data gaps where the relationship between an analogous site and its  
17 assigned representative site is weak
- 18 • The desire to accelerate confirmatory sampling where early data would facilitate decision  
19 making
- 20 • The need to obtain supplemental information on the extent of contamination where data  
21 could lead to a different remedy
- 22 • The need to obtain supplemental data to further characterize the deep vadose zone where  
23 recent knowledge and thinking (i.e., groundwater, tank farm, vadose zone integration,  
24 200-UW-1 OU lessons learned) result in the need for more information.

25 Appendix C contains a summary of the amount and type of existing and supplemental data for  
26 each waste site. The Volume II addenda provide detailed information on each waste site,  
27 including the existing data, sampling strategy, sample location and frequency, and rationale for  
28 the sample design.

29 This SAP is aimed at collecting supplemental data to support the RI/FS process. Therefore, the  
30 sampling design for activities conducted under this SAP is mainly a focused (or judgmental)  
31 strategy aimed at addressing specific data gaps. The focused sampling is a result of having  
32 existing knowledge of waste-site contamination problems either from site-specific information or  
33 from representative sites. These data include construction information, effluent discharge  
34 volumes, contaminant inventories, information from nearby or similar sites, geophysical logging  
35 within or near sites, HRR surveys, and/or site-specific sampling (additional details on sampling  
36 are provided in Section A3.1).

Additional sampling is anticipated following the record of decision to collect confirmatory, design, and verification samples at sites as needed. Post-record of decision sampling needs will be identified through a series of DQO processes as described in Chapter 5.0 of the Supplemental Work Plan.

### A2.2.2 Sampling Methods

This SAP provides information on a variety of intrusive and non-intrusive sampling methods that may be used during the supplemental RI. Data-collection methods include borehole sampling, direct-push sampling, test pit sampling, geophysical surveys, field screening, and other methods as warranted by the data needs. Intrusive, subsurface sampling of vadose zone soils is a main objective of the supplemental RI. In addition, water samples may be collected if encountered in perched zones and/or at the groundwater/vadose interface. Other types of sampling, such as surface sampling or soil vapor sampling, may be warranted in some cases. Non-intrusive data-collection techniques also will be used to augment the existing data and the intrusive supplemental data in evaluating the nature and extent of contamination during the RI/FS process. Details of sample and data-collection methods included in this SAP are provided in Section A3.1 and in Volume II addenda.

#### A2.2.2.1 Decontamination of Sampling Equipment

To prevent contamination of the samples, care should be taken to use clean equipment for each sampling activity. In general, disposable sampling equipment will be used where appropriate. Some sampling equipment, such as split-spoon samplers, may be decontaminated in accordance with decontamination procedures.

Special care should be taken to avoid the following common ways in which cross-contamination or background contamination may compromise the samples:

- Improperly storing or transporting sampling equipment and sample containers
- Contaminating the equipment or sample bottles by setting the equipment/sample bottle on or near potential contamination sources (e.g., uncovered ground)
- Handling bottles or equipment with dirty hands or gloves
- Improperly decontaminating equipment before sampling or between sampling events.

#### A2.2.3 Sample Handling and Custody Requirements

All field-sample handling, shipping, and custody requirements will be consistent with established procedures. Level I EPA pre-cleaned sample containers will be used for soil samples collected for chemical and radiological analysis. Container sizes may vary depending on laboratory-specific volumes/requirements for meeting analytical detection limits. The radiological control technician will measure the contamination levels and dose rates associated with the sample containers. This information, along with other data, will be used to select proper

1 packaging, marking, labeling, and shipping paperwork and to verify that the sample can be  
2 received by the analytical laboratory in accordance with the laboratory's acceptance criteria.  
3 Preliminary container types and volumes are identified in Table A2-5. The final types and  
4 volumes will be indicated on the Sampling Authorization Form prepared by Sample and Data  
5 Management; however, field changes can be made if necessary. Field-determined radiological  
6 properties of the sample also may affect the container size. Each sample container will be  
7 labeled with the following information, using a waterproof marker on firmly affixed,  
8 water-resistant labels:

- 9 • Sampling Authorization Form
- 10 • HEIS number
- 11 • Sample collection date/time
- 12 • Name of person collecting the sample
- 13 • Analysis required
- 14 • Preservation method (if applicable).

15 Except for volatile organic analyte samples, a custody seal (i.e., evidence tape) will be affixed to  
16 the lid of each sample jar. The container seal will be inscribed with the sampler's initials and the  
17 date. Custody tape is not applied directly to volatile organic analyte bottles collected because of  
18 a potential for fouling the laboratory equipment.

19 Sample transportation will be in compliance with the applicable regulations for packaging,  
20 marking, labeling, and shipping hazardous materials, hazardous substances, and hazardous waste  
21 that are mandated by the U.S. Department of Transportation (49 CFR 171-177, Chapter 1,  
22 "Research and Special Programs Administration, Department of Transportation," Part 171,  
23 "General Information, Regulations, and Definitions," through Part 177, "Carriage By Public  
24 Highway") in association with the International Air Transportation Authority, DOE  
25 requirements, and applicable program-specific implementing procedures.

26 Sample custody during laboratory analysis is addressed in the applicable laboratory standard  
27 operating procedures. Laboratory custody procedures will ensure that sample integrity and  
28 identification are maintained throughout the analytical process. Storage of samples at the  
29 laboratory will be consistent with laboratory instructions prepared by Sample and Data  
30 Management.

31 The Fluor Hanford *Sample Data Tracking* database will be used to track the samples from the  
32 point of collection to through the laboratory analysis process. The HEIS database is the  
33 repository for the laboratory analytical results. The HEIS sample numbers will be issued to the  
34 sampling organization for the project. Each radiological, nonradiological, and physical  
35 properties sample will be identified and labeled with a unique HEIS sample number. The sample  
36 location, depth, and corresponding HEIS numbers will be documented in the sampler's field  
37 logbook. All field-sample handling, shipping, and custody requirements will be consistent with  
38 established procedures.

#### A2.2.4 Analytical Methods Requirements

2 Analytical parameters and methods are listed in Tables A2-1, A2-2, and A2-4. These analytical  
3 methods are implemented in accordance with the laboratory's QA plan and the requirements of  
4 this QAPjP. The Project Hanford Management Contractor conducts oversight of offsite  
5 analytical laboratories to qualify them for performing Hanford Site analytical work.

6 Deviations from the analytical methods noted in Tables A2-1, A2-2, and A2-4 must be approved  
7 by the Waste Site Remediation Task Lead. If the laboratory uses a nonstandard or unapproved  
8 method, the laboratory must provide method validation data to confirm that the method is  
9 adequate for the intended use of the data. This includes information such as determination of  
10 detection limits, quantitation limits, typical recoveries, and analytical precision and bias.

11 Laboratories providing analytical services in support of this SAP will have in place a corrective  
12 action program that addresses analytical system failures and documents the effectiveness of any  
13 corrective actions. Errors reported by the laboratories are reported to the Sample and Data  
14 Management Project Coordinator, who is responsible to document analytical errors and to  
15 establish the resolution in coordination with the Waste Site Remediation Task Lead.

16 Communications with the laboratory will be managed by the Sample and Data Management  
17 organization. Sample and Data Management will be responsible for communicating status,  
18 issues, corrective actions, and other pertinent laboratory information to the Waste Site  
19 Remediation Task Lead and the Waste Site Remediation Manager.

#### 20 A2.2.5 Quality Control Requirements

21 The QC procedures must be followed in the field and laboratory to ensure that reliable data are  
22 obtained. Field QC samples will be collected to evaluate the potential for cross-contamination  
23 and to provide information pertinent to field variability. Field QC for sampling will require the  
24 collection of field replicates (duplicates), trip or field blanks, and equipment blanks. Laboratory  
25 QC samples estimate the precision and bias of the analytical data. Quality control sampling is  
26 described here in general terms; actual QC samples and the required frequency for collection are  
27 described in the SSSPs for each waste site to be sampled.

28 The collection of QC samples for onsite measurements may be applicable to some of the  
29 field-screening techniques described in this SAP, such as organic vapor detection.  
30 Field-screening instrumentation will be calibrated and controlled as discussed in Sections A2.2.6  
31 and A2.2.7, as applicable. Onsite measurement QC samples will be identified in the SSSP for  
32 specific sampling techniques as needed.

33 The laboratory method blanks, laboratory control sample/blank spike, and matrix spike are  
34 defined in Chapter 1 of SW-846, *Test Methods for Evaluating Solid Waste: Physical/Chemical*  
35 *Methods, Third Edition; Final Update III-A*, as amended, and will be run at the frequency  
36 specified in that reference.

7 To ensure sample and data usability, the sampling associated with this SAP will be performed in  
38 accordance with established sampling practices, procedures, and requirements pertaining to

1 sample collection, collection equipment, and sample handling. The Field Team Lead and the  
2 Waste Site Remediation Task Lead are responsible for ensuring that all field procedures are  
3 followed completely and that field-sampling personnel are adequately trained to perform  
4 sampling activities under this SAP. The Waste Site Remediation Lead, or the Field Team Lead  
5 at the discretion of the Waste Site Remediation Task Lead, must document all deviations from  
6 procedures or other problems pertaining to sample collection, chain of custody, COPCs, sample  
7 transport, or noncompliant monitoring. As appropriate, such deviations or problems will be  
8 documented in the field logbook or on nonconformance report forms in accordance with internal  
9 corrective-action procedures. The Waste Site Remediation Lead, or the Field Team Lead at the  
10 discretion of the Waste Site Remediation Task Lead, will be responsible for communicating field  
11 corrective-action requirements and for ensuring that immediate corrective actions are applied to  
12 field activities.

### 13 **A2.2.5.1 Field Duplicates**

14 Field duplicates are independent samples collected as close as possible to the same point in space  
15 and time, taken from the same source, stored in separate containers, and analyzed independently.

16 A minimum of one field duplicate will be collected from each waste site where soil sampling is  
17 performed. The duplicate should be collected generally from an interval that is expected to have  
18 some contamination, so that valid comparisons between the samples can be made (i.e., at least  
19 some of the constituents will be above detection limit). When sampling is performed from a split  
20 spoon, volatile organic samples and volatile organic duplicate samples are collected directly  
21 from the sampler. The remaining soil is then composited in a stainless steel mixing bowl. The  
22 soil sample and duplicate sample are collected from this composited material.

### 23 **A2.2.5.2 Field Splits**

24 Field splits of soil samples are not considered necessary to be collected under this SAP.  
25 However, during sampling, sample personnel could identify a need to collect a soil split sample  
26 to verify the performance of the primary laboratory or an outside agency could request a split  
27 sample. If so, the sample medium will be homogenized, split into two separate aliquots in the  
28 field, and sent to two independent laboratories. The split sample will be obtained from a sample  
29 medium suitable for analysis at an offsite laboratory. The split sample will be analyzed for the  
30 analytes listed in the SSSPs in accordance with the analytical requirements listed in Tables A2-1,  
31 A2-2, and A2-4.

### 32 **A2.2.5.3 Equipment Rinsate Blanks**

33 A minimum of one equipment rinsate blank will be collected from each waste site where soil  
34 sampling is performed. The field geologist may request that additional equipment blanks be  
35 taken. Equipment blanks will consist of pure deionized water washed through decontaminated  
36 sampling equipment and placed in containers, as identified on the project Sampling  
37 Authorization Form. Note that the bottle and preservation requirements for water may differ  
38 from the requirements for soil.

Equipment rinsate blanks will be analyzed for the following:

- 2       • When characterization analysis is for radionuclides only
  - 3           – Gamma emitters
  - 4           – Gross alpha
  - 5           – Gross beta
  
- 6       • When characterization analysis is for radionuclides and chemical constituents
  - 7           – Gamma emitters
  - 8           – Gross alpha
  - 9           – Gross beta
  - 10          – Metals (excluding hexavalent chromium and mercury)
  - 11          – Anions
  - 12          – Semivolatile organic analytes
  - 13          – Volatile organic analytes.

#### 14    **A2.2.5.4 Field Blanks**

15    The volatile organic field blanks will constitute approximately 5 percent of all samples  
16    designated for analysis of volatile organic compounds. A minimum of one volatile organic  
17    analyte field blank will be collected at each waste site where the samples will undergo  
18    3 volatile-organic-compound analysis. The field blank will consist of pure deionized water added  
19    to clean sample containers at the location where the volatile organic compound sample was  
20    collected. The field blank will be analyzed only for volatile organic compounds.

#### 21    **A2.2.6 Instrument/Equipment Testing, Inspection, and** 22       **Maintenance Requirements**

23    Measurement and testing equipment used in the field or in the laboratory that directly affects the  
24    quality of analytical data will be subject to preventive maintenance measures to ensure  
25    minimization of measurement system downtime. Laboratories and onsite measurement  
26    organizations must maintain and calibrate their equipment. Maintenance requirements (such as  
27    parts lists and documentation of routine maintenance) will be included in the individual  
28    laboratory and the onsite organization QA plan or operating procedures (as appropriate).  
29    Calibration of laboratory instruments will be performed in a manner consistent with SW-846, as  
30    amended, or with auditable DOE Hanford Site and contractual requirements. Consumables,  
31    supplies, and reagents will be reviewed in accordance with SW-846 requirements and will be  
32    appropriate for their use.

#### 33    **A2.2.7 Instrument Calibration and Frequency**

34    All onsite environmental instruments are calibrated in accordance with the manufacturer's  
35    operating instructions, internal work requirements and processes, and/or work packages that  
36    provide direction for equipment calibration or verification of accuracy by analytical methods.

1 The results from all instrument calibration activities are recorded in logbooks and/or  
2 work packages.

3 Field instrumentation, calibration, and QA checks will be performed in accordance with the  
4 following.

- 5 • Calibration of radiological field instruments on the Hanford Site is performed under  
6 contract by Pacific Northwest National Laboratory, as specified in their program  
7 documentation.
- 8 • Daily calibration checks will be performed and documented for each instrument used to  
9 characterize areas that are under investigation. These checks will be made on standard  
10 materials that are sufficiently like the matrix under consideration that direct comparison  
11 of data can be made. Analysis times will be sufficient to establish detection efficiency  
12 and resolution.

13 Analytical laboratory instruments and measuring equipment are calibrated in accordance with the  
14 laboratories' QA plan.

15 Calibration is conducted with equipment or standards with known valid relationships to  
16 nationally recognized performance standards. Field equipment used in this data-collection  
17 activity that requires calibration will be listed in the fieldwork package. Such equipment is  
18 uniquely identified and calibrated in accordance with the equipment-specific calibration  
19 procedure, including the program for maintaining calibration records traceable to the uniquely  
20 identified piece of equipment. The results from all instrument calibration activities are recorded  
21 in logbooks and/or work packages.

#### 22 **A2.2.8 Inspection/Acceptance Requirements for** 23 **Supplies and Consumables**

24 Supplies and consumables procured by Fluor Hanford that are used in support of sampling and  
25 analysis activities are procured in accordance with internal work requirements and processes that  
26 describe the Project Hanford Management Contractor acquisition system. The procurement  
27 process ensures that purchased items and services comply with applicable procurement  
28 specifications, thereby ensuring that structures, systems, and components, or other items and  
29 services procured/acquired for Fluor Hanford, meet the specific technical and quality  
30 requirements. Supplies and consumables are appropriately issued to the field and then checked  
31 and accepted before use.

32 Supplies and consumables procured by the analytical laboratories are procured, checked, and  
33 used in accordance with their QA plans.

### 2 A2.2.9 Data Acquisition Requirements for Nondirect 3 Measurements

4 Nondirect measurements include data obtained from sources such as computer databases,  
5 programs, literature files, and historical databases. Nondirect measurements (e.g., historical  
6 records and reports) were used extensively in identification of data needs and DQOs for this  
7 supplemental RI. Nondirect measurements are not planned to be acquired as a portion of the  
8 supplemental data-collection activity under this SAP. However, any incidental nondirect  
9 measurement used as data acquired during this SAP activity (e.g., weather data from other  
sources) and used in decision-making will be documented.

### 10 A2.2.10 Data Management

11 Analytical data resulting from the implementation of this QAPjP will be managed and stored in  
12 accordance with the applicable programmatic requirements governing data management  
13 procedures. Electronic data access, when appropriate, will be via a database (e.g., HEIS or a  
14 project-specific database). Where electronic data are not available, hard copies will be provided  
15 in accordance with Section 9.6 of the Tri-Party Agreement (Ecology et al. 1989a).

16 Planning for sample collection and analysis will be in accordance with the programmatic  
17 requirements governing fixed-laboratory sample collection activities, as discussed in the sample  
18 team's procedures. In the event that specific procedures do not exist for a particular work  
19 evolution, or it is determined that additional guidance to complete certain tasks is needed, a work  
20 package will be developed to adequately control the activities, as appropriate. Examples of the  
21 sample team's requirements include activities associated with the following:

- 22 • Chain of custody/sample analysis requests
- 23 • Project and sample identification for sampling services
- 24 • Control of certificates of analysis
- 25 • Logbooks, checklists
- 26 • Sample packaging and shipping.

27 Approved work control packages and procedures will be used to document field activities,  
28 including radiological measurements when this SAP is implemented. All field activities will be  
29 recorded in field logbooks or appropriate forms invoked by procedure. Examples of the types of  
30 documentation for field radiological data include the following:

- 31 • Instructions regarding the minimum requirements for documenting radiological controls  
32 information in accordance with 10 CFR 835, "Occupational Radiation Protection"
- 33 • Instructions for managing the identification, creation, review, approval, storage, transfer,  
34 and retrieval of primary contractor radiological records
- 35 • The minimum standards and practices necessary for preparing, performing, and retaining  
36 radiological-related records
- 37 • The indoctrination of personnel on the development and implementation of sample plans

- 1 • The requirements associated with preparing and transporting regulated material
- 2 • Daily reports of radiological surveys and measurements collected during conduct of field
- 3 investigation activities. Data will be cross-referenced between laboratory analytical data
- 4 and radiation measurements to facilitate interpreting the investigation results.

5 Errors are reported to the Fluor Hanford Office of Sample and Data Management on a routine  
6 basis. Laboratory errors are reported to the Sample Management Project Coordinator, who  
7 initiates a Sample Disposition Record in accordance with Project Hanford Management  
8 Contractor procedures. This process is used to document analytical errors and to establish their  
9 resolution with the Waste Site Remediation Task Lead. The Sample Management Project  
10 Coordinator provides the Sample Disposition Record to the Task Lead for review and signature.  
11 The Sample Disposition Records become a permanent part of the analytical data package for  
12 future reference and for records management.

### 13 **A2.3 ASSESSMENT/OVERSIGHT**

14 This section identifies the activities for assessing project and associated QA and QC activities for  
15 compliance with QAPjP requirements.

#### 16 **A2.3.1 Assessments and Response Actions**

17 The Project Hanford Management Contractor management, regulatory compliance, quality,  
18 and/or health and safety organizations may conduct random surveillances and assessments to  
19 verify compliance with the requirements outlined in this SAP, project work packages, the project  
20 quality management plan, procedures, and regulatory requirements. Project-specific  
21 management assessments will be conducted on an annual basis for activities conducted under  
22 this Work Plan and SAP. Other assessments may be conducted on a random or as-needed basis.  
23 Data obtained under this SAP will undergo DQA in accordance with Section A2.4.3.

24 If circumstances should arise in the field that would dictate the need for additional assessment  
25 activities, these activities would be performed and recorded in accordance with approved  
26 procedures. Deficiencies identified by these assessments will be reported in accordance with  
27 existing programmatic requirements. The project's line management chain coordinates the  
28 corrective actions/deficiencies in accordance with the Project Hanford Management Contractor  
29 Quality Assurance Program, the Corrective Management Action Program, and associated  
30 approved procedures that implement these programs.

31 Oversight activities in the analytical laboratories, including corrective action management, are  
32 conducted in accordance with the laboratories' QA plans. To ensure that laboratory QA  
33 requirements are met, Project Hanford Management Contractor personnel conduct periodic  
34 oversight activities for offsite analytical laboratories in accordance with Hanford Site QA  
35 program requirements to qualify them for performing Hanford Site analytical work.

### A2.3.2 Reports to Management

2 Reports to management on data quality issues will be made if and when these issues are  
3 identified by self-assessments or other types of assessments. Errors reported by the laboratories  
4 are communicated to the Field Team Lead, who initiates a sample disposition record in  
5 accordance with primary contractor procedures. This process is used to document analytical  
6 errors and to establish resolution with the Waste Site Remediation Task Lead.

7 DQA reports will be prepared to evaluate whether the type, quality, and quantity of the data that  
8 were collected meet the quality objectives described in this SAP and in the SSSPs.

### 9 A2.4 DATA VALIDATION AND USABILITY

10 Data validation and usability activities occur after the data-collection phase of the project is  
11 completed. Implementation of these elements determines whether the data conform to the  
12 specified criteria, thus satisfying the project objectives.

#### 13 A2.4.1 Data Review, Validation, and Verification

14 Data will be reviewed, and data verification and validation will be performed on analytical data  
15 sets. These activities confirm that sampling and chain-of-custody documentation is complete  
16 and sample numbers can be tied to the specific sampling location described in Section A2.2, that  
17 samples were analyzed within required holding times identified in Table A2-5, and that sample  
18 analyses met the data quality requirements specified in this QAPjP.

19 Data verification will be performed on analytical data sets to ensure and document that the  
20 reported results reflect what was actually done. The criteria for verification include, but are not  
21 limited to, review for completeness (i.e., all samples were analyzed as requested), use of the  
22 correct analytical method/procedure, transcription errors, correct application of dilution factors,  
23 appropriate reporting of dry weight versus wet weight, and correct application of conversion  
24 factors. Laboratory personnel may perform data verification.

25 Data validation will be performed on analytical data sets to ensure that the data quality goals  
26 established during the planning phase have been achieved. As recommended in EPA guidance  
27 (Bleyler 1988a, *Laboratory Data Validation Functional Guidelines for Evaluating Inorganics*  
28 *Analyses*; Bleyler 1988b, *Laboratory Data Validation Functional Guidelines for Evaluating*  
29 *Organics Analyses*), the criteria for data validation are based on a graded approach. Fluor  
30 Hanford has defined five levels of validation, A – E. Level A is the lowest level and is the same  
31 as verification. Level E is a 100 percent review of all data (e.g., calibration data; calculations of  
32 representative samples from the dataset). Validation will be performed to Level C.

33 Level C validation includes a review of the QC data and specifically requires verification of  
34 deliverables and requested versus reported analyses and qualification of the results based on  
35 analytical holding times; method blank results; matrix spike/matrix spike duplicate; surrogate  
36 recoveries; duplicates; and analytical method blanks. Level C validation will be performed for  
37 up to 5 percent of the data by matrix and analyte group. Analyte group refers to categories, such

1 as radionuclides, volatile chemicals, semivolatiles, polychlorinated biphenyls, metals, anions,  
2 etc. The goal is to cover the various analyte groups and matrices during the validation.

3 No validation of physical data and/or field-screening results will be performed. However, field  
4 QA/QC (Section A2.2) will be reviewed to ensure that the data are useable.

#### 5 **A2.4.2 Validation and Verification Methods**

6 Validation activities will be based on EPA functional guidelines (Bleyler 1988a; Bleyler 1988b).  
7 Data validation may be performed by the analytical laboratory, Sample and Data Management,  
8 and/or by a party independent of both the data collector and the data user.

9 When outliers or questionable results are identified, additional data validation will be performed.  
10 The additional validation will be performed for up to 5 percent of the statistical outliers and/or  
11 questionable data. The additional validation will begin with Level C and may increase to  
12 Levels D and E as needed to ensure that the data are usable. Note that Level C validation is a  
13 review of the QC data, while Levels D and E include review of calibration data and calculations  
14 of representative samples from the dataset. Data validation will be documented in data  
15 validation reports, which will be provided to the Sample and Data Management organization and  
16 in the DQA report (see Section A2.4.3). At least one data validation package will be generated  
17 for each waste site or group of waste sites in the SSSPs. The Sample and Data Management  
18 organization is responsible for distributing the data validation report to the Waste Site  
19 Remediation Task Lead and to others as necessary. The determination of data usability will be  
20 documented in the DQA.

#### 21 **A2.4.3 Reconciliation with User Requirements**

22 Following data verification and validation, the data need to be evaluated to see if they answer the  
23 original questions asked (e.g., DQOs). The DQA process compares completed field-sampling  
24 activities to those proposed in corresponding sampling documents and provides an evaluation of  
25 the resulting data. The purpose of the data evaluation is to determine if quantitative data are of  
26 the correct type and are of adequate quality and quantity to meet the project DQOs. The Waste  
27 Site Remediation Task Lead is responsible for ensuring that a DQA is performed. The results of  
28 the DQA will be reported to the Waste Site Remediation Task Lead and will be used in  
29 interpreting the data and determining if the objectives of this activity have been met.

30 The EPA DQA process, EPA/240/B-06/002, *Data Quality Assessment: A Reviewers Guide*,  
31 EPA QA/G-9R, and EPA/240/B-06/003, *Data Quality Assessment: Statistical Tools for*  
32 *Practitioners*, EPA QA/G-9S, identifies five steps for evaluating data generated from this  
33 project, as summarized below.

34 **Step 1. Review DQOs and Sampling Design.** This step requires a comprehensive review of  
35 the sampling and analytical requirements outlined in the project-specific DQO workbook and  
36 SAP.

2 **Step 2. Conduct a Preliminary Data Review.** In this step, a comparison is made between the  
3 actual QA/QC achieved (e.g., detection limits, precision, accuracy) and the requirements  
4 determined during the DQO. Any significant deviations will be documented. Basic statistics  
5 will be calculated from the analytical data at this point, as appropriate to the data set, including  
an evaluation of the distribution of the data and in accordance with the DQOs.

6 **Step 3. Select the Statistical Test.** Using the data evaluated in Step 2, an appropriate statistical  
7 hypothesis test is selected and justified.

8 **Step 4. Verify the Assumptions.** In this step, the validity of the data analyses is assessed by  
9 determining if the data support the underlying assumptions necessary for the analyses or if the  
10 data set must be modified (e.g., transposed, augmented with additional data) before further  
11 analysis. If one or more assumptions are questioned, Step 3 is repeated.

12 **Step 5. Draw Conclusions from the Data.** The statistical test is applied in this step, and the  
13 results either reject the null hypothesis or fail to reject the null hypothesis. If the latter is true,  
14 the data should be analyzed further. If the null hypothesis is rejected, the overall performance of  
15 the sampling design should be evaluated by forming a statistical power calculation to assess the  
16 adequacy of the sampling design.

#### 17 **A2.4.4 Follow-On Data Quality Objectives**

18 } Because this Work Plan and SAP address supplemental data-collection activities for OUs that  
19 have undergone an initial phase of RI sampling, assessment of the supplemental data in  
20 conjunction with the existing data is needed prior to proceeding to decision making. Data quality  
21 of the supplemental data will be evaluated as described in this QAPjP. In addition, the combined  
22 data sets will be reviewed for usability and to determine if data gaps identified through the DQO  
23 process have been adequately addressed by these combined data sets. The Tri-Parties will  
24 review the combined data sets to ensure that sufficient decision-making data are available prior  
25 to revising or preparing the FSSs. If concerns exist about the ability to make decisions based on  
26 the combined existing and supplemental data, then the Tri-Parties can choose to conduct a  
27 follow-on DQO process to evaluate remaining decision-making data gaps and identify additional  
28 data-collection activities needed to complete the RI/FS process. The Supplemental Work Plan  
29 and SAP will serve as the foundation for any additional data-collection activities identified  
30 through the follow-on DQO process. The follow-on data-collection activities will be  
31 incorporated into the Work Plan and SAP through Volume 2 as SSSPs.

2

### A3.0 FIELD-SAMPLING PLAN

2 The supplemental RI FSP describes the field activities for collection of field observations,  
3 measurements, and samples for laboratory analysis. This FSP provides more detailed  
4 information on sampling methods, field-screening technologies, and waste management  
5 activities. All of the data-collection techniques may not be required at each waste site.  
6 Site-specific FSP addenda are included in Volume 2 that detail supplemental RI activities at each  
7 individual waste site.

8 The objective and purpose of the supplemental RI data collection and this overall FSP are  
9 identified in this Work Plan. The waste sites requiring supplemental data and the type of data  
10 needed are identified in Appendix C. Applicable sampling and data-collection techniques  
11 identified in this overall FSP will be specified in the SSSPs in Volume 2 of this Work Plan.

#### 12 A3.1 DATA-COLLECTION TECHNIQUES

13 As discussed in Section A2.2, a variety of sample methods and measurements may be applicable  
14 to data-collection activities identified for the supplemental RI. The data needs identified through  
15 the supplemental DQO require sampling of different media, including the following:

- 16     • Surface soil
- 7     • Subsurface soil (at depths extending to groundwater)
- 18     • Groundwater (at the water table)
- 19     • Perched water (within the vadose zone)
- 20     • Soil vapor
- 21     • Residual waste materials.

22 This SAP includes a range of data-collection techniques that can be used to obtain vadose zone  
23 information, such as soil samples, physical soil properties, and geophysical surveys for  
24 radionuclides and moisture. Data-collection techniques can be either intrusive (i.e., penetrate the  
25 vadose zone deeper than 0.30 m [1 ft]) or nonintrusive. The following subsections present  
26 common intrusive and non-intrusive techniques that may be used under this SAP. The  
27 techniques discussed in this section are the most commonly used at the Hanford Site to collect  
28 vadose zone data and will represent the majority of the techniques used for supplemental data  
29 collection.

30 A supporting document, SGW-32606, *Characterization Technologies for Waste Site Model*  
31 *Groups*, has been developed that identifies and evaluates techniques that can be used to collect  
32 data. It provides additional technical details on potential data-collection techniques for  
33 waste-site RIs.

##### 34 A3.1.1 Intrusive Collection Techniques

35 Intrusive techniques included in this plan are borehole drilling, direct-push techniques, and test  
36 pitting and trenching.

### 1 **A3.1.1.1 Borehole Drilling and Sampling**

#### 2 **A3.1.1.1.1 Borehole Drilling**

3 Borehole drilling can be conducted using a variety of equipment depending on data needs. For  
4 application at the Central Plateau waste sites, drilling is commonly done with a cable tool rig, or  
5 a similar type rig that allows control of contaminated cuttings; permits spectral gamma, neutron  
6 moisture, and other types of downhole geophysical logging; and provides adequate soil return to  
7 support soil sampling, either through a split-spoon sampler or through a grab sample.

8 Table A3-1 summarizes the different types of sample collection methods and their individual  
9 characteristics.

10 All drilling will be via a method approved by the project, and will conform to site-specific  
11 technical specifications for environmental drilling services. Drill rigs for deep boreholes will  
12 generally require a gravel pad and, in some cases, a gravel access road. Cleaning and  
13 decontamination requirements also will be performed in accordance with approved procedures  
14 and as described in the QAPjP, Section A2.2.2.1.

15 Multiple casing strings may be used by telescoping to reach the proposed total depth for the  
16 borehole and to minimize transport of contaminants in the vadose zone from the drilling  
17 operations. The casing sizes will be of sufficient size to accommodate a split-spoon sampler to  
18 the bottom of the borehole. Downsizing of the casing will be commensurate with the decrease in  
19 contamination levels with depth based on field screening. Actual conditions during drilling may  
20 warrant changes; the changes may be implemented after consultation with, and the approval of,  
21 the Field Team Lead and the Waste Site Remediation Task Lead.

22 After drilling, sampling, and logging the boreholes identified in this SAP, the casing will be  
23 removed and the boreholes will be decommissioned in accordance with WAC 173-160,  
24 "Minimum Standards for Construction and Maintenance of Wells." For combined vadose zone  
25 and groundwater boreholes where the borehole will be drilled into the aquifer and completed as a  
26 groundwater monitoring well, completion activities will be conducted in accordance with a well  
27 design approved by the Field Team Lead. The design will conform to WAC 173-160  
28 requirements or, if needed, a variance to that regulation will be obtained from Ecology prior  
29 to construction.

#### 30 **A3.1.1.1.2 Borehole Sampling**

31 In general, the intent of the borehole sampling design in a waste site is to collect samples at key  
32 areas of interest with depth in the vadose zone. These key areas include, but are not limited to,  
33 the following:

- 34 • Within the 0 to 4.6 m (0 to 15-ft) zone to provide data to support risk assessment for  
35 human health and ecological screening and risk assessment
- 36 • At the bottom of the waste site to evaluate the high concentrations associated with the  
37 very low mobility constituents, such as plutonium and Cs-137

- 2 • At lithologic changes and on top of lower permeability zones where contaminants may be held up in the vadose zone
- 3 • Along the length of the borehole to look for more mobile constituents and to assess residual contamination left behind after discharges ceased
- 4
- 5 • At the outer edges of an HRR or geophysically identified plume or the boundary of the waste site to provide extent information.
- 6

7 Borehole sample collection will be guided by the sampling approaches outlined for the  
 8 individual waste sites or groups of waste sites identified in Volume 2 SSSPs. Actual sampling  
 9 intervals may vary from these approaches, depending on field-screening results and varying  
 10 subsurface conditions. The intent of the sampling design is to generally begin sample collection  
 11 at or just above the bottom of the waste site, depending on waste-site construction. For example,  
 12 in a crib that is constructed with the crib bottom at 3.7 m (12 ft) below ground surface (bgs) and  
 13 a 0.6 m (2-ft) stabilization cover, the mass of the low-mobility contaminants (e.g., Cs-137 and  
 14 plutonium) would be expected to start approximately 4.3 m (14 ft) down. Field screening would  
 15 be used to confirm correct crib bottom depth. Samples may be collected above the waste-site  
 16 bottom to assess backfill material, to support waste site-specific ecological screening, and to  
 17 augment human-health risk assessment if data are not currently available. These near-surface  
 18 samples will be used to supplement ongoing ecological risk assessment for the entire Central  
 19 Plateau.

20 Sampling would continue intermittently (based on the site's conceptual contaminant distribution  
 21 model, results of nearby borehole logging events, and professional judgment of the field  
 22 geologist) to total depth. Samples may be collected for Table A2-1 and Table A2-2 analysis,  
 23 grab sample analysis, physical properties analysis, or focused analysis.

#### 24 A3.1.1.1.3 Split-Spoon Sampling and Analysis

25 Split-spoon sampling and analysis will be used to evaluate all the identified COPCs for a waste  
 26 site that were originally identified in the associated OU RI/FS approved work plans. These  
 27 COPC lists form the COPC lists for the supplemental work (see Table A2-3). In some instances,  
 28 a reduced COPC list will be used based on the amount and quality of the existing data. The  
 29 COPC list for each waste site is included in the SSSPs; a list of COPCs by OU is included in  
 30 Table A2-3. Radiological and nonradiological analytes identified for the Central Plateau and  
 31 their associated analytical performance indicators are presented in Tables A2-1, A2-2, and A2-4.

32 The split-spoon samplers will be equipped with four separate liners, generally stainless steel or  
 33 lexan.<sup>1</sup> Site personnel will not overdrive the sampling device. With the exception of the volatile  
 34 organic analyte samples, soil will be transferred to a pre-cleaned, stainless steel mixing bowl,  
 35 homogenized, and then containerized in accordance with contractor sampling procedures.  
 36 Volatile organic analyte samples will be collected prior to homogenization of the soils.

---

<sup>1</sup> Lexan is a registered trademark of General Electric Company, New York, New York.

#### 1 **A3.1.1.1.4 Grab Sampling and Analysis**

2 To gain a better understanding of the distribution of mobile contaminants (e.g., Tc-99, uranium,  
3 nitrate, nitrite, chromium, tritium, I-129), grab samples may be collected from the drill cuttings.  
4 The purpose of the grab samples is to analyze the contaminants within the pore water of the  
5 vadose zone. These samples will be analyzed using leaching techniques to extract the  
6 contaminants, followed by analysis of the extracts (Table A3-2) for the contaminants listed in  
7 Table A2-3. Grab samples can be collected at short sampling intervals, typically 0.76 m (2.5 ft)  
8 and temporarily stored for analysis. Initially, analysis will be run on a subset of the grab  
9 samples; e.g., the 3 m (10-ft) samples. These results will be reviewed, and additional analysis  
10 will be performed using the intermediate sample intervals (e.g., 0.76 m [2.5-ft] samples) in areas  
11 of elevated concentrations or to refine the understanding of contaminant distribution.

12 Grab samples will be collected into jars directly from the drive barrel cuttings. Samples will be  
13 analyzed at an onsite laboratory. Pore water removal from the soils initially will be attempted by  
14 centrifuge to extract the pore water with pressure. Additionally, water, acid, or both may be used  
15 to leach contaminants from the soil. The soil also will be evaluated for gamma-emitting  
16 radionuclides and total carbon. These analyses will provide more detailed information to  
17 understand distribution and potential movement of mobile COPCs and to support future  
18 modeling efforts, as needed.

#### 19 **A3.1.1.1.5 Physical Properties Sampling and Analysis**

20 Physical property samples will be collected from the boreholes to provide site-specific values to  
21 support the RESRAD dose model (ANL 2005), Subsurface Transport Over Multiple Phases  
22 (STOMP) (PNNL-12028, *STOMP Subsurface Transport Over Multiple Phases, Version 2.0,*  
23 *Application Guide*), or other modeling. General soil properties of interest are pH, moisture  
24 content, grain-size distribution, specific conductivity, and soil density. Samples for soil density  
25 generally will be collected with a split-spoon sampler equipped with four separate stainless steel  
26 or LEXAN liners. Physical property samples will be analyzed in accordance with American  
27 Society for Testing and Materials methods. The physical property samples will be collected  
28 from lithologies that represent the major facies in the vadose zone. The samples will be  
29 collected coincident with nonradiological and radiological split-spoon sample intervals, where  
30 possible. Additional physical properties of interest may include distribution coefficient, porosity,  
31 specific conductivity, or other parameters. Site-specific physical property analyses are identified  
32 in the SSSPs.

#### 33 **A3.1.1.1.6 Focused Sampling and Analysis**

34 Focused analysis may be used to look for specific constituents or to evaluate particular  
35 characteristics of a sample, such as plutonium concentration, distribution coefficient, or  
36 leachability. Focused analysis also may be used if the COPCs for a site have been reduced to  
37 contaminants of concern through a data-supported screening process (such as the risk assessment  
38 or FS processes) or if existing data are sufficient for all but a smaller set of constituents.  
39 Focused sampling analytes and/or parameters will be specified in the SSSPs.

40 If sample volume requirements cannot be met because of sample recovery issues, samples will  
41 be collected according to a priority based on the nature of the data gap being filled. For samples

2 that are being collected to support protection of groundwater analysis, the sample priority will be  
3 given to the grab sample analysis. If plutonium is an identified data need, then priority would be  
4 given to the plutonium analytes. Priority will be established in the SSSPs.

4 Following drilling, the boreholes will be geophysically logged for gamma-emitting  
5 radionuclides, neutron moisture content, and/or passive neutron (see Section A3.1.2.3). These  
6 data will be collected in HEIS; a summary report also will be prepared by the logging contractor  
7 to document the logging activity and results. The logging summary reports will be  
8 documented in the field summary report so they can be referenced in the FS and other documents  
9 as necessary.

### 10 A3.1.1.2 Direct-Push Techniques and Sampling

11 Direct-push techniques use a pushing method, such as a diesel hammer, hydraulic hammer, cone  
12 penetrometer, or GeoProbe,<sup>2</sup> to penetrate the vadose zone to collect soil samples and to obtain  
13 downhole geophysical data (e.g., small-diameter spectral gamma, moisture). These methods  
14 generally are limited in the depth of penetration and in sample volume as compared to borehole  
15 drilling; they are generally less expensive than drilling, however.

16 Direct-push holes may be installed to obtain spectral gamma, neutron moisture, and/or passive  
17 neutron logs and/or vapor samples. Some direct-push technologies also permit sampling. The  
18 number of samples and the depth of sampling are limited and capabilities vary with each method.  
19 Table A3-3 identifies direct-push techniques and their associated capabilities. Direct-push holes  
20 are decommissioned the same as boreholes.

21 Sample collection from the direct-push techniques is done from a driven sampling device, similar  
22 to the split-spoon sampler discussed in the borehole drilling section. Sampling is conducted first  
23 for volatile organic analytes (if required), then soils are homogenized and sampled for the  
24 remainder of the analytes. Site-specific COPCs are identified in the SSSPs, along with analytical  
25 priority. Because of the limited sample size on some methods, focused analysis may be used to  
26 ensure the analytes of highest need to fill the data gap are analyzed. Maximum depth for these  
27 techniques is near 33 m (100 ft); some of the techniques are limited to even lower depths.  
28 Techniques are chosen to address data gaps and may be reevaluated with time to obtain the  
29 appropriate quality of data.

### 30 A3.1.1.3 Test Pitting/Trenching and Sampling

#### 31 A3.1.1.3.1 Test Pitting/Trenching

32 Test pitting and trenching use excavation equipment to reach contaminated soil for sampling.  
33 Test pits are focused excavations, generally with a maximum depth of about 7.6 m (25 ft) bgs.  
34 Depending on site conditions, clean soil can be removed from the surface to gain some additional  
35 depth capability. Soils generally are sampled from the excavator bucket and can be field

---

<sup>2</sup> GeoProbe is a registered trademark of GeoProbe Systems, Salina, Kansas.

1 screened for volatiles or radioactivity. Trenching uses longer excavations to intercept the  
2 contaminated material.

3 Site-specific test pit/trenching locations may be adjusted in the field to account for site  
4 conditions. If basalt is encountered in the test pits, excavations will be halted. Test pits will be  
5 excavated in a manner that minimizes the generation of visible emissions (e.g., dust) from the  
6 site boundary during excavator operations by use of water or a fixant sprayed on the site before  
7 and during the activity. If visible emissions cannot be controlled, the activity will be postponed.  
8 When the slope of the sides is too steep for the safe use of heavy excavation equipment, a  
9 shallow test pit can be accessed using hand augers and shovels. Although not planned, a  
10 hollow-stem auger may be used as an alternative if it is more cost-effective and does not impact  
11 data quality.

### 12 **A3.1.1.3.2 Test Pit/Trench Sampling**

13 Generally, the samples will be collected at the bottom of the waste-site structure (i.e., discharge  
14 point; e.g., at the bottom of the crib structure or the originally excavated trench bottom), or upon  
15 the first detection of radiological contamination above background levels, whichever is  
16 encountered first. A general sampling scheme that has been used at other Central Plateau test  
17 pits/trenches is to sample at 0.75 m (2.5-ft) intervals to 3 m (10 ft) bgs, then at 1.5 m (5-ft)  
18 intervals to the desired sampling depth up to 7.6 m (25 ft) bgs. Actual site-specific sampling  
19 depths will be based on the site-specific conditions and data needs; these are specified in the  
20 Volume 2 SSSPs. Additional samples may be collected at the discretion of the geologist/sampler  
21 based on visual conditions, field-screening information, and professional judgment. Critical  
22 samples will be collected at 4.6 m (15 ft) bgs, at the waste-site structure bottom, and for ponds, at  
23 the organic layer that represents the pond bottom. If contamination is observed during the  
24 excavation process either visually (e.g., staining) or via field-screening equipment at the  
25 maximum sampling depth, an additional deeper sample may be attempted (depending on the  
26 limitations of the excavation equipment) for further resolution of the vertical contamination  
27 concentration profile. Samples may be collected in backfill material to support risk assessment  
28 and to verify the backfill material is clean.

29 Sampling from test pits and/or trenches will be performed in accordance with approved  
30 procedures. Samples from a test pit generally will be collected from the site sediment layer  
31 (e.g., pond bottom/organic mat) as identified through radiological field screening, visual  
32 observation, and judgment of the geologist/sampler or at the first detection of contamination  
33 (generally above background), whichever is encountered first. Where ALARA considerations  
34 allow, samples can be taken directly from the test pit strata. Alternatively, samples will be  
35 collected directly from the excavator bucket, which will target the interval 0.3 m (1 ft) below the  
36 specified sampling depth. This will help ensure that the sample target depth material is  
37 accessible in the bucket. Volatile samples will be collected first in accordance with approved  
38 procedures; they will be collected directly from the excavator bucket into appropriate sample  
39 containers to minimize loss to the atmosphere. For the remainder of the analytes, sample  
40 material will be scooped from the bucket into a pre-cleaned, stainless steel mixing bowl,  
41 homogenized, and then containerized in accordance with sampling procedures. Samples will be  
42 handled and managed as described in the QAPjP (see Section A2.2.3). Samples generally will  
43 not be collected to evaluate soil physical properties from test pit and trenches.

#### 2 A3.1.1.4 Shallow Auger Drilling and Sampling

3 Shallow auger drilling uses an auger drilling method to obtain vadose zone samples. Samples  
4 are retrieved at the surface as cuttings, which can be sampled as described under the borehole  
5 sampling section or can be sampled from a split-spoon sampler. Augering represents a fast and  
6 inexpensive method of collecting focused samples for specific purposes. Depth discrete samples  
7 can be difficult with augers, however. In addition, physical property samples are not usually  
collected with this method because of the limited depth capability.

#### 8 A3.1.1.5 Surface Sampling

9 Surface sampling is used to collect soil samples in the upper few inches to few feet of the vadose  
10 zone. Surface sampling is usually assumed to be limited to 0.6 to 0.9 m (2 to 3 ft) in depth, the  
11 area that can easily be reached with hand tools. Beyond these depths or for a lot of sample  
12 locations, direct-push techniques become more efficient. Surface samples can be collected by  
13 digging soils with hand tools and placing them into clean, stainless steel bowls for  
14 homogenization. In addition, surface soils also may be collected using a multi-incremental  
15 sampling technique, where small aliquots of soils are collected over the surface area and  
16 submitted for analysis. This technique results in mean concentrations for analytes within the  
17 sample area. While this type of sampling is not initially planned for the supplemental activities,  
18 future sampling activities may benefit from this technique. If so, the details, including QA  
19 information, will be included with the SSSP for that waste site or activity.

#### 20 A3.1.2 Non-Intrusive Collection Techniques

21 Non-intrusive techniques can be used to augment the soil samples collected through the intrusive  
22 sampling techniques. These techniques consist of a broad range of geophysical, radiological, and  
23 field-screening applications that can provide data on radionuclides, physical parameters,  
24 chemicals, vapors, and other characteristics that add to the understanding of the nature and extent  
25 of contamination. Additional information on the range of techniques is provided in SGW-32606.  
26 The most common techniques are discussed in the following sections. Site-specific techniques  
27 are detailed in the Volume 2 SSSPs.

#### 28 A3.1.2.1 Soil Vapor Measurements

29 Vapor samples may be collected from boreholes or direct-push holes at locations where volatile  
30 organics are a concern. As drilling or direct-push activities proceed, monitoring for volatile  
31 organics will be performed by an industrial hygiene technician. The industrial hygiene  
32 technician will monitor the air space immediately surrounding the borehole as the borehole  
33 drilling proceeds and during soil-sample removal. Soil-vapor samples will be collected using a  
34 commercial inflatable rubber packer, or test plug, with a vapor-sampling tube attached. The  
35 packer/test plug will be inserted to the required sample depth near the bottom of the casing. The  
36 packer/test plug will be inflated to seal off the casing and leave the end of the sampling tube  
37 exposed to soil vapor in or near the open portion of the borehole. An in-line high-efficiency  
8 particulate air filter will be installed in the air-sampling line for radiological screening. An  
39 air-sampling pump will be used to withdraw vapor from the sampling tube. Gross volatile  
40 organic compound concentration in the air stream will be measured using a handheld photo

1 ionization detector. Measurements will be recorded. Once the sample line and borehole have  
2 been purged, an air sample will be collected in a Tedlar<sup>3</sup> bag. The packer/test plug will be  
3 deflated and removed, and the in-line high-efficiency particulate air filter will be radiologically  
4 screened. Once radiological screening is complete, volatile organic compound concentrations in  
5 the Tedlar bag will be analyzed using the Innova<sup>4</sup> multigas monitor or equivalent field-screening  
6 instrument.

#### 7 **A3.1.2.2 Surface Radiological Surveys**

8 A surface radiation survey will be performed as part of the excavation permit process at each  
9 waste site to be investigated to locate and quantify the presence of surface radioactive  
10 contamination and verify process knowledge and to support worker health and safety during RI  
11 activities. Radiological surveys will be performed in accordance with radiological control  
12 procedures and documents. Instrument calibration and survey records will be completed in  
13 accordance with applicable radiological control procedures. Survey instruments will be  
14 calibrated, maintained, and operated in a manner that meets the performance requirements of this  
15 SAP. A post-sampling survey also will be performed at each sampling site to ensure that  
16 sampling activities have not contributed to surface contamination.

#### 17 **A3.1.2.3 Downhole Geophysical Logging**

18 Boreholes and direct pushes generally will be logged with a high-resolution spectral gamma-ray  
19 logging system to provide continuous vertical logs of gamma-emitting radionuclides, and with a  
20 neutron moisture-logging system to identify moisture changes. In addition, existing boreholes  
21 may be logged with the spectral gamma and/or moisture-logging systems. The spectral gamma  
22 logging of existing wells in the vicinity of a waste site can be a cost-effective method of  
23 providing supplemental data on the vertical and lateral distribution of gamma-emitting  
24 radionuclides. The spectral gamma logging system uses instrumentation to identify and quantify  
25 gamma-emitting radionuclides in wells as a function of depth.

26 The spectral gamma logging system uses laboratory-grade high-purity germanium HPGe  
27 detectors to collect 4096-channel gamma energy spectra at discrete depth increments.  
28 Radionuclide identification and assay are based on characteristic gamma emissions associated  
29 with decay. At each depth increment, the gamma energy spectrum is analyzed to detect peaks,  
30 and to determine net count rate, counting error, and minimum detectable activity for each peak.  
31 The energy resolution capability of the detector varies between approximately 2 and 4 keV,  
32 depending on energy level and background activity. Net counts from individual gamma energy  
33 peaks are processed with the detector calibration function, dead time correction, casing  
34 correction, and water correction to determine the bulk concentration, the analytical error, and the  
35 minimum detectable level. All quantities are reported in pCi/g. For selected radionuclides  
36 specific regions of interest can be "forced" to determine the minimum detectable activity even  
37 when no peak is detected. Thus, the minimum detectable activity and analytical error are

---

<sup>3</sup> Tedlar is a registered trademark of E. I. du Pont de Nemours and Company, Wilmington, Delaware.

<sup>4</sup> Innova is a trademark of Innova AirTech Instruments S/S Naerum, Denmark.

1 calculated on a point-by point basis and shown on the log plot. The minimum detectable activity  
2 depends on the intensity (yield) of the characteristic gamma ray, detector efficiency, casing  
3 thickness, and background activity level.

4 A logging system is defined as a unique combination of downhole sonde (detector) and logging  
5 system (cable, winch, power supply, control system, and data acquisition system). The spectral  
6 gamma logging system and the neutron moisture logging system are calibrated on an annual  
7 basis, or after any significant repairs or modifications to either the sonde or the logging system.  
8 Calibration measurements are made at the Hanford Calibration Facility, located near the central  
9 weather station, just east of the Hanford 200 West Area. Each calibration is documented with a  
10 calibration certificate.

11 The neutron-moisture logging system that measures moisture employs a weak americium  
12 beryllium neutron source and neutron detector to provide a direct reading of hydrogen atom  
13 distribution in the soil surrounding the borehole. This detector will be used to measure  
14 continuous vertical moisture in the vadose zone. The spectral gamma logs will be used to  
15 supplement the laboratory radionuclide data to determine the vertical distribution of  
16 radionuclides in the vadose zone beneath the units and to aid in geological interpretation of  
17 subsurface stratigraphy. The deep boreholes will be logged through the casing before a new  
18 casing string is added and after the well has reached total depth. The spectral gamma logging  
19 equipment calibration is conducted annually, and the data acquired during the calibrations are  
20 used to derive factors that convert measured peak-area count rate to radionuclide concentrations  
21 in picocuries per gram. Corrections are applied to the data to compensate for the gamma ray  
22 attenuation by the casing.

23 Logging runs will be made before the casing sizes are changed and at the total depth of the  
24 borehole. The downhole tools and cable will be subject to the same rules as are the drill rig and  
25 equipment. The downhole tools and cable will be cleaned between boreholes. The upper part of  
26 each borehole will be the most contaminated and will be logged first.

27 Small-diameter direct-push holes can be logged using small-diameter spectral gamma and  
28 moisture logging instruments. These instruments function in the same manner as the instruments  
29 used in larger-diameter boreholes, but they have been adapted to work inside the  
30 smaller-diameter casings associated with the direct-push techniques.

31 Geophysical logging data will be collected in HEIS; a summary report also will be prepared by  
32 the logging contractor to document the logging activity and results. The logging summary  
33 reports will be documented in the field summary report so they can be referenced in the FS and  
34 other documents as necessary.

#### 35 **A3.1.2.4 High-Resolution Resistivity Description**

36 The resistivity method is based on the capacity of earth materials to resist electrical current.  
37 Earth resistivity is a function of soil type, porosity, moisture, and dissolved salts. The concept  
38 behind applying the resistivity method is to detect and map changes or distortions in an imposed  
39 electrical field due to heterogeneities in the subsurface.

1 The objective of HRR surveys is to identify and characterize areas of high electrical conductivity  
2 beneath and adjacent to waste sites or groups of waste sites area that could be related to  
3 subsurface contaminant plumes. The HRR data can also be used to ascertain flow direction (if  
4 not vertical) of high ionic strength solutions that may be migrating downward, and presumably  
5 laterally but beyond the reach of other, more shallow geophysical methods.

6 The HRR technique has the capability of detecting and mapping sufficiently large active plumes  
7 and their footprints from near surface to the saturated zone. Initial efforts to establish  
8 relationships between HRR data and soil contaminant concentrations in the Central Plateau have  
9 shown strong correlation with soil pore water contamination and electrical conductivity.

10 HRR appears to be best suited for evaluation of the extent of relatively deep vadose zone  
11 contamination that has high mobility. Deeper active plumes are expected to consist of the more  
12 mobile contaminants. The shallow plumes are expected to consist of the less mobile  
13 constituents. The deeper the plume, however, the larger the sampling volume required to  
14 adequately resolve the plume. Highly sorbed contaminants, such as Cs-137, that are not  
15 associated with the soil pore water are not expected to contribute significantly to overall  
16 soil conductivity.

17 Interrogation depth is dependent on the length of the line of electrodes employed to collect the  
18 data. Capability to evaluate the Hanford Site Central Plateau entire vadose zone (i.e., to  
19 approximately 107 m [350 ft] bgs) is readily achieved.

#### 20 **A3.1.2.5 Field-Screening Techniques**

21 Field screening can be used to identify the bottom of the waste site (i.e., crib/trench) and adjust  
22 sampling points, assist in determining sample shipping requirements, and support worker health  
23 and safety monitoring. This section will identify several field-screening instruments that may be  
24 used during the course of the field investigations. All field-screening instruments used will be  
25 maintained and calibrated in accordance with the manufacturer's specifications and approved  
26 procedures. The field geologist or sampling personnel will record field-screening results.

##### 27 **A3.1.2.5.1 Portable Radiological Detection Instruments**

28 Radiological screening of samples and cuttings from RI activities will be conducted by the  
29 radiological control technician or other qualified personnel for evidence of radioactive  
30 contamination. Surveys of these materials will be conducted visually and with field instruments.  
31 The radiological control technician will record all field measurements, noting the depth of the  
32 sample and the instrument reading.

33 Before drilling begins, a local area background reading will be taken with the field-screening  
34 instruments at a background site to be selected in the field. The site geologists will use  
35 professional judgment and screening data to finalize sampling decisions in the field as needed.

36 The field action level for radionuclide screening is twice background. Intervals above this field  
37 action level will be assessed for sampling by the field geologist. If a waste site is determined to  
38 be a high and/or medium risk site for RI, then a temporary field storage area will be established  
39 at the site. Additionally, samples that exceed background will be stored in a temporary field

2 storage area at the site until evaluated by waste management personnel. Radiological control requirements will be established on the samples as required.

3 **A3.1.2.5.2 Portable Organic Detection Instruments and Other Field-Screening Techniques**

4 Table A3-4 identifies common field-screening techniques for organic and metal constituents.  
5 Screening for volatile organics will be performed by the health and safety technician using a  
6 photoionization detector or other methods, if required by the site-specific health and safety plan.  
7 Monitoring for volatile organics also can be conducted during drilling, test pit excavation, or  
8 direct-push investigations to support possible soil gas vapor sampling.

9 In situ determination of organics and metals in soil generally is limited to qualitative or  
10 semi-quantitative analysis. The only technology identified for subsurface in situ analysis is  
11 laser-induced fluorescence, and this has only been applied to hydrocarbons. Handheld X-ray  
12 fluorescence can be used on surface soils for quantitative analysis of metals. These instruments  
13 have improved to the point where most metals can be determined in the tens of parts per million,  
14 but this may still not be low enough to meet desired remedial action goals.

15 Several field techniques for ex situ analysis of organic and inorganic analytes may be applicable  
16 to characterization of soils on the Central Plateau. Chemical and immunoassay colorimetric kits  
17 are available for a wide range of constituents and many have detection limits suitable to the  
18 project's needs. These techniques require the extra step of liquid extraction of constituents from  
19 soil and performing some simple wet chemistry. Detection limits for field X-ray fluorescence  
20 also may be improved by sample processing (i.e., soil sieving), but data from this technology  
21 represent the total species present in the sample, not only the dissolvable contaminants, so may  
22 not be directly comparable to laboratory analyses performed with EPA protocols.

23 Field instruments, while perhaps not sensitive or quantitative enough to demonstrate clean  
24 closure, can be valuable in looking at existing contamination distribution during initial  
25 characterization sampling, and/or directing some opportunistic sampling of "hot spots" or  
26 contamination extent.

2

## A4.0 HEALTH AND SAFETY PLAN

2 The purpose of this chapter is to identify hazards that may be encountered during implementation  
3 of the FSP and establish a preliminary framework of actions to mitigate those hazards in the  
4 field. All field operations will be performed in accordance with Project Hanford Management  
5 Contractor health and safety requirements and the appropriate project-specific procedures. In  
6 addition, work control packages will be prepared in accordance with procedures that will further  
7 control site operations. These packages will include activity job-hazard analyses, site-specific  
8 health and safety plans, and applicable radiological work permits. Work will be performed in  
9 accordance with site-specific health and safety plans and applicable radiological work permits.

10 The sampling procedures and associated activities will take into consideration exposure  
11 reduction and contamination control techniques that will minimize the radiation exposure to the  
12 sampling team.

13 Health and safety personnel will use historical information, data collected during the previous RI  
14 activities, and real-time field screening as input to determine exposure levels to workers and to  
15 conduct health and safety assessments in accordance with the health and safety plan.

### 16 A4.1 HAZARD IDENTIFICATION AND 17 MITIGATION

18 Performing field investigations at hazardous waste sites involves potential exposure to hazards  
19 related to the contaminants present at the site, the nature of the intended work, and the  
20 environment in which the work will be performed. This section identifies general physical,  
21 biological, chemical, and radiological hazards that may be encountered as this supplemental RI is  
22 implemented. Hazards that are specific to individual waste sites will be identified and addressed  
23 in site-specific job-hazard analyses and site-specific health and safety plans.

#### 24 A4.1.1 Physical Hazards

25 Physical hazards associated with the planned work include machine or mechanical hazards,  
26 location hazards, and environmental hazards. These hazards are summarized in Table A4-1.

#### 27 A4.1.2 Biological Hazards

28 Biological hazards may be presented by organisms in and near the work area. Biological hazards  
29 include venomous creatures (e.g., snakes, spiders, scorpions, bees, and wasps), poisonous plants  
30 (e.g., nettles, poison oak/ivy), and large animals (e.g., coyotes). Biological hazards also may  
31 include blood-borne pathogens in situations where exposure to human body fluids is possible.  
32 These hazards are generally mitigated by situational awareness and personal protective  
33 equipment.

1 **A4.1.3 Chemical Hazards**

2 The waste sites to be investigated during the supplemental RI are known to be contaminated with  
3 varying quantities of hazardous chemicals. Chemical hazards for each site will be assessed prior  
4 to starting field activities, and requirements for mitigating potential hazards will be identified.  
5 Real-time air-quality monitoring will be used as appropriate to identify changes in air quality and  
6 to determine whether health and safety action levels have been exceeded. The general types of  
7 chemical hazards that may be encountered during the supplemental RI field activities are  
8 summarized in Table A4-2.

9 **A4.1.4 Radiological Hazards**

10 Many of the sites that are the focus of the supplemental RI are known to be radiologically  
11 contaminated. Intrusive investigation into these sites (i.e., drilling, sampling, excavating)  
12 presents potential exposure to ionizing radiation. The radiological contaminants known to be  
13 present at these sites include alpha-, beta-, and gamma-emitting radionuclides. Potential hazards  
14 associated with these contaminants include direct exposure to ionizing radiation, contamination  
15 of skin, and ingestion/inhalation of airborne contaminants.

16 Sites with known or suspected radiological contamination will be evaluated prior to intrusive  
17 activities, and radiological work permits will be developed prior to work. The radiological work  
18 permits will address radiological monitoring requirements as well as protective clothing and  
19 respiratory protection requirements for the planned work.

20 **A4.2 TRAINING AND MEDICAL MONITORING**

21 Field personnel will be required to demonstrate current training as required by specific tasks.  
22 Training is expected to include 40- or 80-hour training to meet the requirements for hazardous  
23 waste operations and emergency response, and Hanford Site-specific access and radiation worker  
24 training at a minimum (also see Section A2.1.5). Additional training may be required for  
25 personnel operating specific equipment. Annual medical monitoring also will be required as  
26 well as respiratory protection training and a current respiratory protection equipment fit test.

**A5.0 INVESTIGATION-DERIVED WASTE**

2 Waste generated by sampling activities will be managed consistent with the existing approved  
3 waste control plans for the OUs, with revisions to these waste control plans to incorporate the  
4 supplemental data-collection activities, and/or with new waste control plan(s) yet to be  
5 developed for the activity.

6 Because offsite laboratories to be used for sample analysis are licensed to manage and dispose of  
7 unused sample material, returns from offsite laboratories are not expected. However, sample  
8 material from onsite or offsite laboratories will be managed as sample returns and will be  
9 dispositioned with the investigation-derived waste for the waste site in accordance with the  
10 approved waste control plan.

DOE/RL-2007-02 DRAFT A

Table A2-1. Analytical Performance Requirements for Radionuclides. (3 Pages)

Contaminants of Potential Concern	Chemical Abstracts Service No.	Preliminary Action Level <sup>a</sup> (pCi/g)			Hanford Site Background <sup>f</sup> pCi/g	Name/ Analytical Technology	Required Detection Limits		Soil <sup>d</sup> (%)		Water <sup>d</sup> (%)		
		Human Health (15 mrem/yr <sup>b</sup> )		Ground-water Protection <sup>c</sup>			Ecological Protection	Water (pCi/L)	Soil (pCi/g)	Precision	Accuracy	Precision	Accuracy
		Industrial	Un-restricted										

- <sup>a</sup> The preliminary action level (from the data quality objectives process) is the regulatory- or risk-based value used to determine appropriate analytical requirements (e.g., detection limits). Remedial action levels will be proposed in the feasibility study, will be finalized in the record of decision, and will drive remediation of the sites.
- <sup>b</sup> 15 mrem/yr = nonradiological worker industrial exposure scenario; 2,000 h/yr onsite, 60% indoors, 40% outdoors. Industrial land-use values generally apply to locations within the industrial exclusive area (Core Zone) and are dependent on the nature and extent of contamination. Unrestricted land-use values that could be applied at some sites outside the industrial-exclusive land-use area are shown.
- <sup>c</sup> Groundwater protection radionuclide values are based on either RESRAD (ANL, 2005, *RESRAD for Windows*, Version 6.3, or STOMP (PNNL-12028, *STOMP Subsurface Transport Over Multiple Phases, Version 2.0, Application Guide*) modeling of drinking water exposure, with the entire vadose zone presumed to be contaminated. This modeling is yet to be completed and groundwater protection values are to be determined.
- <sup>d</sup> Precision and accuracy requirements as identified and defined in the referenced U.S. Environmental Protection Agency procedures implemented by laboratory analysis and quality assurance procedures.
- <sup>e</sup> If ICP/MS is used, analysis individual isotopes will be quantified.
- <sup>f</sup> Values are from DOE/RL-96-12, *Hanford Site Background: Part 2, Soil Background for Radionuclides*, using the 95% upper confidence limit for a lognormal distribution.
- <sup>g</sup> Values are for U-234.
- <sup>h</sup> Values are for U-235.
- 
- AEA = alpha energy analysis.
- GEA = gamma energy analysis.
- GPC = gas proportional counting.
- ICP/MS = inductively coupled plasma mass spectrometer.

AT-9

DOE/RL-2007-02 DRAFT A

Table A2-2. Analytical Performance Requirements for Nonradionuclides. (7 Pages)

Chemical Abstracts Service No.	Preliminary Action Level <sup>a</sup> (mg/kg)			Hanford Site Background <sup>b</sup>	Name/ Analytical Technology	Required Detection Limits (mg/kg) <sup>d</sup>		Soil <sup>e</sup> (%)		Water <sup>f</sup> (%)		
	Direct Contact, WAC 173-340 <sup>b</sup> (mg/kg)		Ground-water Protection <sup>c</sup>			Ecological Protection (mg/kg)	Water (mg/L)	Soil (mg/kg) <sup>g</sup>	Precision	Accuracy	Precision	Accuracy
	Method C Industrial	Method B Unrestricted										

- <sup>a</sup> The preliminary action level (from the data quality objectives process) is the regulatory or risk-based value used to determine appropriate analytical requirements (e.g., detection limits). Remedial action levels will be proposed in the feasibility study, will be finalized in the record of decision, and will drive remediation of the sites.
  - <sup>b</sup> Method C industrial is WAC 173-340-745(5), "Soil Cleanup Standards for Industrial Properties," "Method C Industrial Soil Cleanup Levels" and Method B residential is WAC 173-340-740(3), "Unrestricted Land Use Soil Cleanup Standards," "Method B Soil Cleanup Levels for Unrestricted Land Use," values from Ecology 94-145, *Cleanup Levels and Risk Calculations under the Model Toxics Control Act Cleanup Regulation; CLARC, Version 3.1*, tables, updated November 2001.
  - <sup>c</sup> Calculated using WAC 173-340, "Model Toxics Control Act - Cleanup," three-phase model for soil concentrations protective of groundwater per WAC 173-340-747(4), "Deriving Soil Concentrations for Ground Water Protection," "Fixed Parameter Three-Phase Partitioning Model."
  - <sup>d</sup> Value is the lowest concentration for each analyte (adjusted for background) from Tables 749-2 and 749-3 of WAC 173-340-900, "Tables," amended February 12, 2001.
  - <sup>e</sup> Precision and accuracy requirements as defined in EPA procedures and implemented by laboratory analysis and Quality Assurance procedures. Precision criteria for batch laboratory replicate sample analyses. Accuracy criteria for associate batch laboratory control sample percent with additional evaluations also performed for matrix spikes, tracers, and carriers as appropriate to the method.
  - <sup>f</sup> All four-digit numbers are found in SW-846, *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods, Third Edition; Final Update III-A*. EPA Method 200.8 is found in EPA/600/4-91/010, Methods for the Determination of Metals in Environmental Samples.
  - <sup>g</sup> Based on WAC 173-340 Method A values from Tables 740-1 and 745-1 of WAC 173-340-900.
  - <sup>h</sup> Values are from DOE/RL-92-24, *Hanford Site Background: Part 1, Soil Background for Nonradioactive Analytes*, using the 90<sup>th</sup> percentile with a lognormal distribution.
  - <sup>i</sup> Calculated using air cleanup standards from WAC 173-340-750(3)(b)(ii)(B), "Cleanup Standards to Protect Air Quality," "Method B Air Cleanup Levels," "Standard Method B Air Cleanup Levels," "Human Health Protection," "Carcinogens," page 210, equation 750-2, with Washington State Department of Health mass loading of particulates in air of 10<sup>-4</sup> g/m<sup>3</sup>.
  - <sup>j</sup> Not regulated under WAC 173-340
  - <sup>k</sup> Calculated using standards for surface water protection (40 CFR 131, "Water Quality Standards," and WAC 173-201A-040, "Water Quality Standards for Surface Waters of the State of Washington," "Toxic Substances") as inputs to the three-phase model for protection of drinking water (WAC 173-340-747[4], February 12, 2001).
  - <sup>l</sup> Based on Method A values from WAC 173-340-900, Tables 740-1 and 745-1, amended February 12, 2001.
  - <sup>m</sup> Cleanup value is less than Hanford Site soil background. Therefore, the soil background concentration is used as the preliminary action level.
  - <sup>n</sup> Because the calculated groundwater protection action level is less than the soil detection limit, the calculated value is replaced with the target quantitation limit required of the laboratory.
  - <sup>o</sup> From Ecology 97-602, *Analytical Methods for Petroleum Hydrocarbons*.
  - <sup>p</sup> Value based on nickel or uranium soluble salts value.
  - <sup>q</sup> From EPA/600/4-79/020, *Methods for Chemical Analysis of Water and Wastes*.
  - <sup>r</sup> Required Target Quantitation Limit for setting laboratory detection limits is generally established using the preliminary action levels or background whichever is lowest.

Table A2-4. Analytical Performance Requirements for Grab Samples. (2 Pages)

Parameter	Reason for Measuring	Method *	Contract-Required Detection Limit	Precision Required	Accuracy Required
<b>Vadose Sediments</b>					
Calcium carbonate content (more correctly includes total carbon, inorganic carbon, and organic carbon by difference)	This parameter influences the pH buffering capacity of the sediment. Calcium carbonate also is a cementing material in porous sediments that influences the hydraulic conductivity and porosity. Organic carbon content influences bioremediation technologies.	ASTM E1915, EPA 9060A (SW-846) or EPA Method 415.1	N/A	N/A	N/A
Pore water or 1:1 water extract	Vadose sediments generally do not have drainable water that can be readily obtained for analysis. Existing pore water must be "squeezed" out by overcoming the capillary forces holding the water in the partially saturated pores or by adding deionized water to "flush" out the pore water. Dependent on the size of vadose zone sample available, its field moisture content and particle size, either ultracentrifugation or 1:1 water extraction technique are used to obtain the pore water for further analysis, as described below.	Ultracentrifuge (ideal equipment is unsaturated flow apparatus) or 1:1 water extract (American Society of Agronomy (Rhoades 1996).	N/A	N/A	N/A
<b>Vadose Sediment Pore Water</b>					
Major cations (e.g., sodium, potassium, magnesium, calcium)	Useful for understanding overall geochemical conditions that control contaminant-sediment interactions.	ASTM C1111-04 or EPA Method 6010B (SW-846)	N/A	N/A	N/A
Specific electrical conductivity	An inexpensive indicator of the total dissolved ion concentration of groundwater.	ASTM D112595 (2005) or EPA Method 9050A	N/A	N/A	N/A
pH	Key parameter for controlling acid-base buffering capacity or aquifer-sediment system. Generally influences most remediation technologies.	ASTM D1293 or EPA Method 9045D (SW-846)	0.1 pH unit	±0.1 pH unit	±0.1 pH unit
Major anions in sediment pore water (e.g., sulfate, chloride, fluoride, nitrate, phosphate, bicarbonate/carbonate)	Influences remediation techniques that rely on anion-exchange resins (U(VI), Tc-99) and is useful for understanding overall geochemical conditions that control contaminant-sediment interactions.	Use ion chromatography; the following two methods are equivalent: ASTM D4327-03 or EPA Method 9056 (SW-846)		30%	30%

Table A2-4. Analytical Performance Requirements for Grab Samples. (2 Pages)

Parameter	Reason for Measuring	Method <sup>a</sup>	Contract-Required Detection Limit	Precision Required	Accuracy Required
Contaminant of concern concentrations (includes RCRA metals, Tc-99, I-129, and U-238)	Provides dissolved concentrations of each contaminant of concern at each depth in the borehole; provides detailed information to evaluate high-resolution resistivity data and to evaluate remedial alternatives.	Various techniques dependent on contaminant of concern; today most RCRA metals and long-lived radionuclides (e.g., uranium, Tc-99, I-129, Pu-239) are measured with inductively coupled plasma/mass spectrometer using ASTM D5673-05 or EPA Method 6020 (SW-846). See Tables A2-1 and A2-2 for specific methods and analytical requirements for the specified constituents.	see Tables A2-1 and A2-2	see Tables A2-1 and A2-2	see Tables A2-1 and A2-2
Gamma-emitting radionuclides	Correlates with other laboratory data for borehole and with geophysical logs	Gamma energy analysis	see Tables A2-1 and A2-2	see Tables A2-1 and A2-2	see Tables A2-1 and A2-2

- \*4-digit EPA methods are found in SW-846, *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods, Third Edition; Final Update III-A*, as amended. EPA Method 300.0 is found in EPA/600/R-93/100, *Methods for the Determination of Inorganic Substances in Environmental Samples*.
- <sup>a</sup>Optimal volumes, which may be adjusted downward to accommodate the possibility of retrieval of a small amount of sample. Minimum sample size will be defined on the Sampling Authorization Form.
- <sup>b</sup>Should samples be liquid rather than soils, the following volumes need to be collected:
- Radionuclides** – 4 L for all radionuclides (except C-14, tritium, and Tc-99; they require approximately 500 mL for each sample).
- Chemicals** – All liquid samples require the amount listed for soil samples. Preservation and holding times also are affected if liquid samples are collected. Consult Sample Management staff for details.
- <sup>c</sup>Mixed soil samples may be obtained and submitted to the analytical laboratory for analyses for specific analytes, including the following:
- Radionuclides** – 100 g of soil for all radionuclides (except C-14, tritium, and Tc-99; they require approximately 10 g for each sample).
- Chemicals** – A 10 g soil sample is required for all ICP analysis, 10 g soil sample is required for IC anion analysis, 5 g soil sample for hexavalent chromium analysis, 10 g soil sample for 8015 analysis, and 125 g soil samples for each 8270 and total organic carbon analyses.
- <sup>d</sup>The EPA Method 300.0 nitrate, nitrite, and phosphate holding time is 48 hours after sample extraction preparation. The holding time of 28 days applies to all other anions quantified by EPA Method 300.0.
- <sup>e</sup>The first number shown is the number of days to extract and the second number is the number of days to analyze the extract.
- aG = amber glass.
- CVAA = cold vapor atomic absorption.
- EPA = U.S. Environmental Protection Agency.
- G = glass.
- IC = ion chromatography.
- ICP = inductively coupled plasma.
- P = plastic.
- SVOA = semivolatile organic analyte.
- VOA = volatile organic analyte.

Table A3-1. Summary of Sample Collection Techniques. (2 Pages)

Media	Sampling Technique	Applicability	Comment
Surface soil	Shovel or hand trowel	Surface to 1 ft bgs	No power equipment required
Subsurface soil	Hand auger	Surface to less than 10 ft bgs	Simple technique, no powered equipment required
	Hollow stem auger w/ split-spoon sampler	Surface to about 50 ft bgs	Rapid technique, provides intact core samples. May not work well in soil with high gravel/cobble content
	Cable tool with split-spoon sampler	Surface to water table (no depth limit)	Slower technique, provides relatively intact cores, generally provides adequate sample volume for analysis, controls spread of contamination, generates larger waste volume as all cuttings are brought to the surface, can sample from cuttings as well
	Test pit with excavator	Surface to less than 25 ft bgs	Simple, provides simultaneous access to soil profile
	Direct-push sampler	Surface to about 100 ft bgs	Rapid, in some applications and depths can provide continuous core sample
Surface water	Direct collection into container	Accessible surface water	Simple but requires direct approach to open water
	Peristaltic pump	Accessible surface water, limited to about 25 ft vertical lift	Allows collection of sample at a distance from open water
Groundwater	Submersible pump in monitoring well	No depth limit	Produces high quality/reproducible samples
	Bailer in monitoring well	No depth limit	Produces high quality/reproducible samples
Perched water	Submersible pump in open borehole, temporary well, or monitoring well	No depth limit	Samples from open borehole or temporary wells may contain high suspended solids, may require filtration
	Bailer in open borehole, temporary well, or monitoring well	No depth limit	Samples from open borehole or temporary wells may contain high suspended solids, may require filtration
Soil vapor	Air sampling pump and Tedlar bag or sample canister	No depth limit	May require samples from multiple levels to assess stratification of dense vapors

Table A3-1. Summary of Sample Collection Techniques. (2 Pages)

Media	Sampling Technique	Applicability	Comment
Residual waste materials	Direct sample collection into container	Openly accessible materials	Simple, but requires direct approach to the material
	Drill rig with drive point sampler	Waste in tanks or subsurface locations	Techniques and hardware used for tank waste sampling at Hanford Site is available
	Direct sample collection with coliwasa or other sampling device	Waste in tanks or other containers	Simple, but requires direct approach to the material

4

Table A3-4. Direct Push Technologies (2 Pages)

Technology	Penetration Depth	Sample Size	State of Development	Comments	Relative Cost
Conventional Drilling					
Cable tool	Deep (500+ ft)	2.5 to 5 in. dia. split-spoon	Commercial – widely available and routinely used	Typically used in radiologically contaminated areas	Medium to high
Air rotary	Deep	2.5 to 5 in. dia. split-spoon	Commercial – widely available	Cannot be used to characterize volatiles	Medium to high
Percussion (Becker hammer, other types of drive casing)	Medium (<200 ft, depending on geology)	2.5 to 5 in. dia. split-spoon	Commercial – widely available and routinely used		Medium
Sonic	Medium (<300 ft, depending on geology)	2.5 to 5 in. dia. split-spoon	Commercial – widely available	Stratigraphy in split spoon may not be representative; can heat formation and sample to high temperatures	Medium
Hollow-stem auger	Shallow (<50 ft)	2.5 to 5 in. dia. split-spoon	Commercial – widely available	Brings soil to surface, so not for use in radiological areas	Low
Directional drilling	Deep	Unknown	Commercial – widely available	Requires a drilling mud, which could mobilize contamination. Only demonstrated at Hanford Site.	High

AT-21

DOE/RL-2007-02 DRAFT A

Table A3-4. Direct Push Technologies (2 Pages)

Technology	Penetration Depth	Sample Size	State of Development	Comments	Relative Cost
Other Technologies					
Cone penetrometer	Medium (<150 ft, depending on geology)	1 in dia., 2 ft long	Commercial – widely available	Stymied by competent sediments, cobbles/boulders	Medium
Enhanced Access Penetration System	Medium to Deep (250 ft, depending on geology)	1 in dia., 2 ft long	Mature – some refinement needed for difficult conditions	Cone penetrometer that can also drill through fine sediments, boulders	Medium
GeoProbe	Shallow (<100 ft)	1 in dia., 1 ft long	Commercial – widely available	Stymied by competent sediments, cobbles/boulders	Low to Medium
Test pit/trench	Shallow (<30 ft)	Huge	Commercial – widely available	Brings soil to surface, so not for use in radiological areas	Low

- GeoProbe is a registered trademark of GeoProbe Systems, Salina, Kansas.
- FH= Fluor Hanford.

Table A3-4. Field Survey Technologies for Organics and Metals.

<b>Technology</b>	<b>Capabilities</b>	<b>Interferences/ Limitations</b>	<b>Other Considerations</b>	<b>Relative Data Quality/Interpretation</b>
X-ray fluorescence	Measures metal concentration by direct contact with soil	Soil texture/moisture may affect performance; some inter-element interferences	Turnaround time in minutes, good for screening, adequate for characterization, adequate for monitoring	Quantitative; instrument has built-in calibrations. Soil: moderate. Water: Not applicable
Chemical Colorimetric kits	Measures many organic and inorganic analytes after soil digestion	Inter-element interferences not uncommon	Must react soil with solutions, then measure color change	Quantitative to semi-quantitative, depending on analyte
Immunoassay colorimetric kits	Measures many organic and inorganic analytes after soil digestion	Multi-step procedure, not available for some contaminants of concern	Must react soil with solutions, then measure color change	Quantitative; very low detection limits for some analytes

1

Table A4-1. Summary of Physical Hazards.

Type of Hazard	Specific Hazard	Potential Impact	Mitigation Approach
Mechanical	Powered Equipment/moving parts	Pinchpoints/ entanglement	Use trained operators, inspect and maintain equipment
	Electrical hazards	Electrocution	Use ground fault circuit interrupters on portable equipment
	Material handling	Strains, sprains, physical injuries	Use appropriate manpower and powered equipment as necessary
	Overhead and underground utilities	Electrocution, explosion, toxic effects	Identify and avoid utilities during investigation, hand-dig where underground utility location is uncertain.
Location	Steep/uneven terrain	Slip, trip and fall, vehicle and equipment rollover	Walk and drive on identified travel paths, prepare level work area if necessary
	Open water	Drowning	Establish barriers and/or use individual personal protective equipment
	Open Excavations	Sidewall collapse, burial	Inspect and maintain excavations, maintain access/egress
	Traffic	Collision with vehicles and pedestrians	Establish work areas, use traffic control
Environmental	Heat stress	Reduced productivity, heat injury, death	Establish heat stress work regimens based on ambient conditions, nature of work, and required personal protective equipment. Monitor workers.
	Cold stress	Reduced productivity, heat injury, death	Establish cold stress work regimens based on ambient conditions, nature of work, and required personal protective equipment. Monitor workers.
	Severe weather	Threats posed by strong wind, heavy rain/snow, lightning, flash floods.	Monitor weather conditions during field operations and respond appropriately.

2

Table A4-2. Summary of Chemical Hazards.

Type of Hazard	Specific Hazard	Potential Impact	Mitigation Approach
Airborne toxic chemicals	Volatile organic compounds (e.g., carbon tetrachloride)	Acute or chronic toxic effects by inhalation	Perform real-time air monitoring and implement respiratory protection as indicated.
	Suspended particulate in dust (e.g., toxic metals)	Acute or chronic toxic effects by inhalation	Perform real-time air monitoring and implement respiratory protection as indicated.
	Volatile inorganic compounds (e.g., ammonia)	Acute or chronic toxic effects by inhalation	Perform real-time air monitoring and implement respiratory protection as indicated.
Direct contact with toxic chemicals	Corrosive chemicals (e.g., acids and caustics)	Chemical injury to exposed skin or tissues	Use protective clothing, gloves, and eyewear when potential exposure exists.
	Acutely toxic chemicals (e.g., hydrofluoric acid)	Acute toxic effects by inhalation or absorption	Use protective clothing, gloves, and eyewear when potential exposure exists.
	Ingestion of contaminated soil	Acute toxic effects by ingestion	Avoid ingestion of contaminated soil, use protective clothing, maintain hygiene. Do not eat or drink in contaminated areas.
Flammable and/or reactive chemicals	Fire and/or explosion hazards	Burns and physical injury, equipment damage	Assess site conditions, monitor for the presence of combustible gases if indicated. If reactive chemicals may be present, implement contaminant-specific handling protocols.

## APPENDIX B

POTENTIAL APPLICABLE OR RELEVANT  
AND APPROPRIATE REQUIREMENTSB1.0 IDENTIFICATION OF CENTRAL PLATEAU OPERABLE UNITS  
POTENTIAL ARARS

This appendix identifies and evaluates potential applicable or relevant and appropriate requirements (ARAR) for waste site remediation within the Central Plateau operable units (OU). The potential ARARs identified in this appendix have been used to form the basis for the levels to which contaminants must be remediated to protect human health and the environment. The *Comprehensive Environmental Response, Compensation, and Liability Act of 1980* (CERCLA) provides for the identification of to be considered (TBC) nonpromulgated advisories, criteria, guidance, or proposed standards that may be consulted to interpret remediation goals when ARARs do not exist or are insufficient. Independent of the TBC and ARARs identification process at the Hanford Site, the requirements of U.S. Department of Energy directives must be met.

Because the waste sites in the Central Plateau OUs will be remediated under a CERCLA decision document, remedial and corrective actions at the sites will be required to meet ARARs. This appendix identifies and evaluates potential ARARs for these sites. Future feasibility studies for the various Central Plateau OUs will develop a set of preliminary ARARs that will be used in the evaluation process. Final ARARs for remediation will be established in the record of decision. In many cases, the ARARs form the basis for the preliminary remediation goals to which contaminants must be remediated to protect human health and the environment. In other cases, the ARARs define or restrict how specific remedial measures can be implemented.

The ARARs identification process is based on CERCLA guidance (EPA/540/G-89/006, *CERCLA Compliance with Other Laws Manual: Interim Final*, and EPA/540/G-89/004, *Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA, Interim Final*, OSWER 9355.3-01). Section 121 of CERCLA as amended, requires, in part, that any applicable or relevant and appropriate standard, requirement, criterion, or limitation promulgated under any Federal environmental law, or any more stringent state requirement promulgated pursuant to a state environmental statute, be met (or a waiver justified) for any hazardous substance, pollutant, or contaminant that will remain on site after completion of remedial action.

An "applicable" requirement is a requirement that a private party would have to comply with by law if the same action were being undertaken apart from CERCLA authority. All jurisdictional prerequisites of the requirement must be met for the requirement to be applicable.

"Relevant and appropriate" requirements means those cleanup standards that address problems or situations sufficiently similar to those encountered at the CERCLA site that their use is well suited to the particular site (40 CFR 300.5, "National Oil and Hazardous Substances Pollution

1 Contingency Plan,” “Definitions”). An ARAR may not meet one or more jurisdictional  
2 prerequisites for applicability but still may make sense at the site, given the circumstances of the  
3 site and the release. In evaluating the relevance and appropriateness of a requirement, the eight  
4 comparison factors in 40 CFR 300.400(g)(2), “Identification of Applicable or Relevant and  
5 Appropriate Requirements,” are considered:

- 6 (i) The purpose of the requirement and the purpose of the CERCLA action
- 7 (ii) The medium regulated or affected by the requirement and the medium contaminated  
8 or affected at the CERCLA site
- 9 (iii) The substances regulated by the requirement and the substances found at the  
10 CERCLA site
- 11 (iv) The actions or activities regulated by the requirement and the remedial action  
12 contemplated at the CERCLA site
- 13 (v) Any variances, waivers, or exemptions of the requirement and their availability for the  
14 circumstances at the CERCLA site
- 15 (vi) The type of place regulated and the type of place affected by the release or CERCLA  
16 action
- 17 (vii) The type and size of structure or facility regulated and the type and size of structure or  
18 facility affected by the release or contemplated by the CERCLA action
- 19 (viii) Any consideration of use or potential use of affected resources in the requirement and  
20 the use or potential use of the affected resource at the CERCLA site.

21 In addition, potential ARARs were evaluated to determine if they fall into one of three  
22 categories: chemical specific, location specific, or action specific. These categories are defined  
23 as follows.

- 24 • Chemical-specific requirements are usually health- or risk-based numerical values or  
25 methodologies that, when applied to site-specific conditions, result in the establishment  
26 of public and worker safety levels and site cleanup levels.
- 27 • Location-specific requirements are restrictions placed on the concentration of dangerous  
28 substances or the conduct of activities solely because they occur in special geographic  
29 areas.
- 30 • Action-specific requirements are usually technology- or activity-based requirements or  
31 limitations triggered by the remedial actions performed at the site.

32 In summary, a requirement is applicable if the specific terms or jurisdictional prerequisites of the  
33 law or regulations directly address the circumstances at a site. If not applicable, a requirement  
34 may nevertheless be relevant and appropriate if (1) circumstances at the site are, based on best  
35 professional judgment, sufficiently similar to the problems or situations regulated by the

2 requirement and (2) the requirement's use is well suited to the site. Only the substantive  
 3 requirements (e.g., use of control/containment equipment, compliance with numerical standards)  
 4 associated with ARARs apply to CERCLA on-site activities. ARARs associated with  
 5 administrative requirements, such as permitting, are not applicable to CERCLA on-site activities  
 6 (CERCLA, Section 121[e][1]). In general, this CERCLA permitting exemption will be extended  
 7 to all remedial and corrective action activities conducted at the OU, with the exception of the  
 8 *Resource Conservation and Recovery Act of 1976 (RCRA) treatment, storage, and/or disposal*  
 9 *units, which will be incorporated into WA7890008967, Hanford Facility Resource Conservation*  
 10 *and Recovery Act Permit, Dangerous Waste Portion, Revision 8, for the Treatment, Storage, and*  
*Disposal of Dangerous Waste.*

11 TBC information is nonpromulgated advisories or guidance issued by Federal or state  
 12 governments that is not legally binding and does not have the status of potential ARARs. In  
 13 some circumstances, TBCs will be considered along with ARARs in determining the remedial  
 14 action necessary for protection of human health and the environment. The TBCs complement  
 15 the ARARs in determining protectiveness at a site or implementation of certain actions. For  
 16 example, because soil cleanup standards do not exist for all contaminants, health advisories,  
 17 which would be TBCs, may be helpful in defining appropriate remedial action goals.

18 Potential Federal and state ARARs are presented in Tables B-1 and B-2, respectively.

## B2.0 ARAR WAIVERS

20 The U.S. Environmental Protection Agency (EPA) may waive ARARs and select a remedial  
 21 action that does not attain the same level of site cleanup as that identified by the ARARs.  
 22 Section 121 of the *Superfund Amendments and Reauthorization Act of 1986* identifies six  
 23 circumstances in which the EPA may waive ARARs for on-site remedial actions. The six  
 24 circumstances are as follows:

- 25 • The remedial action selected is only a part of a total remedial action (such as an interim  
 26 action), and the final remedy will attain the ARAR upon its completion
- 27 • Compliance with the ARAR will result in a greater risk to human health and the  
 28 environment than alternative options
- 29 • Compliance with the ARAR is technically impracticable from an engineering perspective
- 30 • An alternative remedial action will attain an equivalent standard of performance through  
 31 the use of another method or approach

Table B-1. Identification of Potential Federal Applicable or Relevant and Appropriate Requirements and To Be Considered for the Remedial Action Sites. (3 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
<b>Chemical-Specific</b>			
<b>"National Primary Drinking Water Regulations," 40 CFR 141</b>			
"Maximum Contaminant Levels for Organic Contaminants," 40 CFR 141.61	ARAR	Establishes MCLs that are drinking water criteria designed to protect human health from the potential adverse effects of organic contaminants in drinking water.	The groundwater in the Central Plateau is not currently used for drinking water. However, Central Plateau groundwater may be considered a potential drinking water source and, because the groundwater discharges to the Columbia River (which is used for drinking water), the substantive requirements in 40 CFR 141.61 for organic constituents are relevant and appropriate.
"Maximum Contaminant Levels for Inorganic Contaminants," 40 CFR 141.62	ARAR	Establishes MCLs that are drinking water criteria designed to protect human health from the potential adverse effects of inorganic contaminants in drinking water.	The groundwater in the Central Plateau is not currently used for drinking water. However, Central Plateau groundwater may be considered a potential drinking water source and because the groundwater discharges to the Columbia River (which is used for drinking water), the substantive requirements in 40 CFR 141.62 for inorganic constituents are relevant and appropriate.
"Maximum Contaminant Levels for Radionuclides," 40 CFR 141.66	ARAR	Establishes MCLs that are drinking water criteria designed to protect human health from the potential adverse effects of radionuclides in drinking water.	The groundwater in the Central Plateau is not currently used for drinking water. However, Central Plateau groundwater may be considered a potential drinking water source and because the groundwater discharges to the Columbia River (which is used for drinking water), the substantive requirements in 40 CFR 141.66 for radionuclides are relevant and appropriate.
<b>"Polychlorinated Biphenyls (PCBs) Manufacturing, Processing, Distribution in Commerce, and Use Prohibitions," 40 CFR 761</b>			
"Applicability," 40 CFR 761.50(b)(1) 40 CFR 761.50(b)(2) 40 CFR 761.50(b)(3) 40 CFR 761.50(b)(4) 40 CFR 761.50(b)(7) 40 CFR 761.50(c)	ARAR	These regulations establish standards for the storage and disposal of PCB wastes.	The substantive requirements of these regulations are applicable or relevant and appropriate to the storage and disposal of PCB liquids, items, remediation waste, and bulk product waste at $\geq 50$ p/m.  The specific subsections identified from 40 CFR 761.50(b) reference the specific sections for the management of PCB waste type. The disposal requirements for radioactive PCB waste are addressed in 40 CFR 761.50(b)(7).

Table B-1. Identification of Potential Federal Applicable or Relevant and Appropriate Requirements and To Be Considered for the Remedial Action Sites. (3 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
<b>Location-Specific</b>			
<i>Archeological and Historic Preservation Act</i> , 16 USC 469aa-mm	ARAR	Requires that remedial actions at Central Plateau operable unit waste sites do not cause the loss of any archaeological or historic data. This act mandates preservation of the data and does not require protection of the actual waste site or facility.	Archeological and historic sites have been identified within the Central Plateau; therefore, the substantive requirements of this act are applicable to actions that might disturb these sites.
<i>National Historic Preservation Act of 1966</i> , 16 USC 470, Section 106	ARAR	Requires Federal agencies to consider the impacts of their undertaking on cultural properties through identification, evaluation and mitigation processes, and consultation with interested parties.	Cultural and historic sites have been identified within the 200 Areas; therefore, the substantive requirements of this act are applicable to actions that might disturb these types of sites.
<i>Native American Graves Protection and Repatriation Act</i> , 25 USC 3001, et seq.	ARAR	Establishes Federal agency responsibility for discovery of human remains, associated and unassociated funerary objects, sacred objects, and items of cultural patrimony.	Substantive requirements of this act are applicable if remains and sacred objects are found during remediation and will require Native American Tribal consultation in the event of discovery.
<i>Endangered Species Act of 1973</i> , 16 USC 1531 et seq., Subsection 16 USC 1536(c)	ARAR	Prohibits actions by Federal agencies that are likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification or critical habitat. If remediation is within critical habitat or buffer zones surrounding threatened or endangered species, mitigation measures must be taken to protect the resource.	Substantive requirements of this act are applicable if threatened or endangered species are identified in areas where remedial actions will occur.

Table B-1. Identification of Potential Federal Applicable or Relevant and Appropriate Requirements and To Be Considered for the Remedial Action Sites. (3 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
<b>Action-Specific</b>			
<b>"National Emission Standard for Asbestos," 40 CFR 61, Subpart M; "Applicability," 40 CFR 61.140</b>			
"Standard for Demolition and Renovation," 40 CFR 61.145	ARAR	Specifies that facilities be inspected for the presence of asbestos before demolition. The standard defines regulated asbestos-containing materials and establishes removal requirements based on quantity present and handling requirements. These requirements also specify handling and disposal requirements for regulated sources that have the potential to emit asbestos. Specifically, no visible emissions are allowed during handling, packaging, and transport of asbestos-containing materials.	Although asbestos-containing materials are not anticipated, substantive requirements of this standard are applicable, should this remedial action include abatement of asbestos and asbestos-containing materials on pipelines or buried asbestos. As a result, there is a potential to emit asbestos to unrestricted areas, and the requirements for the removal, handling, and packaging of asbestos apply.
"Standard for Waste Disposal for Manufacturing, Fabricating, Demolition, Renovation, and Spraying Operations," 40 CFR 61.150	ARAR	Identifies the requirements for the removal and disposal of asbestos from demolition and renovation activities.	Although asbestos-containing materials are not anticipated, the substantive requirements of this standard are applicable, should asbestos-containing material be located during remedial action activities of associated pipelines and buried asbestos.
<b>Regulations pursuant to the <i>Resource Conservation and Recovery Act of 1976</i> and implemented through WAC 173-303, "Dangerous Waste Regulations" (see Table B-2).</b>			

- ARAR = applicable or relevant and appropriate requirement.  
 CFR = *Code of Federal Regulations*.  
 MCL = maximum contaminant level.  
 PCB = polychlorinated biphenyl.  
 TBC = to be considered.  
 WAC = *Washington Administrative Code*.

Table B-2. Identification of Potential State Applicable and Relevant or Appropriate Requirements and To Be Considered for the Remedial Action Sites. (8 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
<b>Chemical-Specific</b>			
<b>"Model Toxics Control Act -- Cleanup," WAC 173-340</b>			
"Soil Cleanup Standards for Industrial Properties," WAC 173-340-745(5)(b)	ARAR	Identifies the methods used to identify risk-based concentrations and their use in the selection of a cleanup action. Cleanup and remediation levels are based on protection of human health and the environment, the location of the site, and other regulations that apply to the site. The standard specifies cleanup goals that implement the strictest Federal or state cleanup criteria.	The State-established risk-based concentrations for soils and protection of groundwater are relevant and appropriate to the OU waste-site remedial actions, because no Federal standard exists.
<b>Action-Specific</b>			
<b>"Dangerous Waste Regulations," WAC 173-303</b>			
"Identifying Solid Waste," WAC 173-303-016	ARAR	Identifies those materials that are and are not solid wastes.	Substantive requirements of these regulations are applicable, because these define how to determine which materials are subject to the designation regulations. Specifically, materials that are generated for removal from the CERCLA site during the remedial action would be subject to the procedures for identification of solid waste to ensure proper management.
"Recycling Processes Involving Solid Waste," WAC 173-303-017	ARAR	Identifies materials that are and are not solid wastes when recycled.	Substantive requirements of these regulations are applicable, because these define how to determine which materials are subject to the designation regulations. Specifically, materials that are generated for removal from the CERCLA site during the remedial action would be subject to the procedures for identification of solid waste to ensure proper management.
"Designation of Dangerous Waste," WAC 173-303-070(3)	ARAR	Establishes the method for determining whether a solid waste is, or is not, a dangerous waste or an extremely hazardous waste.	Substantive requirements of these regulations are applicable to materials encountered during the remedial action. Specifically, solid waste that is generated for removal from the CERCLA site during this remedial action would be subject to the dangerous waste designation procedures to ensure proper management.

Table B-2. Identification of Potential State Applicable and Relevant or Appropriate Requirements and To Be Considered for the Remedial Action Sites. (8 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
“Excluded Categories of Waste,” WAC 173-303-071	ARAR	Describes those categories of wastes that are excluded from the requirements of WAC 173-303 (excluding WAC 173-303-050).	The conditions of this requirement are applicable to remedial actions in the OU, should wastes identified in WAC 173-303-071 be encountered.
“Conditional Exclusion of Special Wastes,” WAC 173-303-073	ARAR	Establishes the conditional exclusion and the management requirements of special wastes, as defined in WAC 173-303-040.	Substantive requirements of these regulations are applicable to materials encountered during the remedial action. Specifically, the substantive standards for management of special waste are applicable to the interim management of certain waste that will be generated during the remedial action.
“Requirements for Universal Waste,” WAC 173-303-077	ARAR	Identifies those wastes exempted from regulation under WAC 173-303-140 and WAC 173-303-170 through 173-303-9907 (excluding WAC 173-303-960). These wastes are subject to regulation under WAC 173-303-573.	Substantive requirements of these regulations are applicable to materials encountered during the remedial action. Specifically, the substantive standards for management of universal waste are applicable to the interim management of certain waste that will be generated during the remedial action.
“Recycled, Reclaimed, and Recovered Wastes,” WAC 173-303-120 Specific Subsections: WAC 173-303-120(3) WAC 173-303-120(5)	ARAR	These regulations define the requirements for recycling materials that are solid and dangerous waste. Specifically, WAC 173-303-120(3) provides for the management of certain recyclable materials, including spent refrigerants, antifreeze, and lead-acid batteries. WAC 173-303-120(5) provides for the recycling of used oil.	Substantive requirements of these regulations are applicable to certain materials that might be encountered during the remedial action. Recyclable materials that are exempt from regulation as dangerous waste and that are not otherwise subject to CERCLA as hazardous substances can be recycled and/or conditionally excluded from certain dangerous waste requirements.
“Land Disposal Restrictions,” WAC 173-303-140(4)	ARAR	This regulation establishes state standards for land disposal of dangerous waste and incorporates, by reference, Federal land-disposal restrictions of 40 CFR 268, “Land Disposal Restrictions,” that are applicable to solid waste that is designated as dangerous or mixed waste in accordance with WAC 173-303-070(3).	The substantive requirements of this regulation are applicable to materials encountered during the remedial action. Specifically, dangerous/mixed waste that is generated and removed from the CERCLA site during the remedial action for off-site (as defined by CERCLA) land disposal would be subject to the identification of applicable land-disposal restrictions at the point of generation of the waste. The actual off-site treatment of such waste would not be ARAR to this remedial action, but instead would be subject to all applicable laws and regulations.

Table B-2. Identification of Potential State Applicable and Relevant or Appropriate Requirements and To Be Considered for the Remedial Action Sites. (8 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
"Requirements for Generators of Dangerous Waste," WAC 173-303-170	ARAR	Establishes the requirements for dangerous waste generators.	Substantive requirements of these regulations are applicable to materials encountered during the remedial action. Specifically, the substantive standards for management of dangerous/mixed waste are applicable to the interim management of certain waste that will be generated during the remedial action. For purposes of this remedial action, WAC 173-303-170(3) includes the substantive provisions of WAC 173-303-200 by reference. WAC 173-303-200 further includes certain substantive standards from WAC 173-303-630 and -640 by reference.
"Closure and Post-Closure," WAC 173-303-610	ARAR	This regulation establishes the closure performance standards applicable to all Hanford Site TSD units.	These requirements are applicable to the closure of RCRA TSD unit OUs.
"Surface Impoundments," WAC 173-303-650	ARAR	Specifies closure and postclosure requirements for surface impoundments.	This regulation is applicable to TSD units that are permitted as a "Surface Impoundment" and subject to the requirements identified in WAC 173-303-665.
"Landfills," WAC 173-303-665	ARAR	Specifies closure and post-closure requirements for landfills.	This regulation is applicable to TSD units that are permitted as a "landfill" and subject to the requirements identified in WAC 173-303-665.
<b>"Minimum Functional Standards for Solid Waste Handling," WAC 173-304</b>			
"On-Site Containerized Storage, Collection and Transportation Standards for Solid Waste," WAC 173-304-200(2)	ARAR	Establishes the requirements for the on-site storage of solid wastes that are not radioactive or dangerous wastes.	Substantive requirements of these regulations are applicable to materials encountered during the remedial action. Specifically, nondangerous, nonradioactive solid wastes (i.e., hazardous substances that are only regulated as solid waste) that will be containerized for removal from the CERCLA site would be managed on site according to the substantive requirements of this standard.

Table B-2. Identification of Potential State Applicable and Relevant or Appropriate Requirements and To Be Considered for the Remedial Action Sites. (8 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
<b>"Solid Waste Handling Standards," WAC 173-350</b>			
"On-Site Storage, Collection, and Transportation Standards," WAC 173-350-300	ARAR	Establishes the requirements for the temporary storage of solid waste in a container on site and the collecting and transporting of the solid waste.	The substantive requirements of this newly promulgated rule are relevant and appropriate to the on-site collection and temporary storage of solid wastes at the OU remediation waste sites. Compliance with this regulation is being implemented in phases for existing facilities.
<b>"Minimum Standards for Construction and Maintenance of Wells," WAC 173-160</b>			
WAC 173-160-161	ARAR	Identifies well planning and construction requirements.	The substantive requirements of this regulation are applicable to actions that include construction of wells used for groundwater extraction, monitoring, or injection of treated groundwater or wastes.
WAC 173-160-171	ARAR	Identifies the requirements for locating a well.	
WAC 173-160-181	ARAR	Identifies the requirements for preserving natural barriers to groundwater movement between aquifers.	
WAC 173-160-191	ARAR	Identifies the design and construction requirements for completing wells.	
WAC 173-160-201	ARAR	Identifies the casing and liner requirements for water supply wells.	
WAC 173-160-221	ARAR	Identifies the requirements for sealing materials.	
WAC 173-160-231	ARAR	Identifies the requirements for surface seals on water wells.	
WAC 173-160-241	ARAR	Identifies the requirements for formation sealing.	
WAC 173-160-271	ARAR	Identifies the special sealing standards for driven wells, jetted wells, and dewatering wells.	
WAC 173-160-281	ARAR	Identifies the construction standards for artificial gravel-packed wells.	
WAC 173-160-291	ARAR	Identifies the standards for the upper terminal of water wells.	
WAC 173-160-301	ARAR	Identifies the requirements for the temporary surface barrier.	
WAC 173-160-311	ARAR	Identifies the requirements for well tagging.	

Table B-2. Identification of Potential State Applicable and Relevant or Appropriate Requirements and To Be Considered for the Remedial Action Sites. (8 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
WAC 173-160-321	ARAR	Identifies the standards for testing a well.	
WAC 173-160-331	ARAR	Identifies the method for keeping equipment and the water well free of contaminants.	
WAC 173-160-341	ARAR	Identifies the method for ensuring the quality of the well water.	
WAC 173-160-351	ARAR	Identifies the standards for the installation of a pump.	
WAC 173-160-371	ARAR	Identifies the standard for chemical conditioning.	
WAC 173-160-381	ARAR	Identifies the standard for decommissioning a well.	
WAC 173-160-400	ARAR	Identifies the minimum standards for resource protection wells and geotechnical soil borings.	
WAC 173-160-420	ARAR	Identifies the general construction requirements for resource protection wells.	
WAC 173-160-430	ARAR	Identifies the minimum casing standards.	
WAC 173-160-440	ARAR	Identifies the equipment cleaning standards.

WAC 173-160-460	ARAR	Identifies the decommissioning process for resource protection wells.	
<b>"General Regulations for Air Pollution Sources," WAC 173-400</b>			
"General Standards for Maximum Emissions," WAC 173-400-040 WAC 173-400-113	ARAR	Methods of control shall be employed to minimize the release of air contaminants associated with fugitive emissions resulting from materials handling, construction, demolition, or other operations. Emissions are to be minimized through application of best available control technology.	Substantive requirements of these standards are relevant and appropriate to this remedial action, because there may be visible, particulate, fugitive, and hazardous air emissions and odors resulting from decontamination, demolition, and excavation activities. As a result, standards established for the control and prevention of air pollution are relevant and appropriate.

Table B-2. Identification of Potential State Applicable and Relevant or Appropriate Requirements and To Be Considered for the Remedial Action Sites. (8 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
<b>“Controls for New Sources of Toxic Air Pollutants,” WAC 173-460</b>			
“Control Technology Requirements,” WAC 173-460-030 WAC 173-460-060	ARAR	Requires that new sources of air emissions provide the emission estimates identified in this regulation.	Substantive requirements of these standards are applicable to this remedial action, because there is the potential for toxic air pollutants to become airborne as a result of decontamination, demolition, and excavation activities. As a result, standards established for the control of toxic air contaminants are relevant and appropriate.
“Ambient Impact Requirement,” WAC 173-460-070	ARAR	Requires that when applying for a notice of construction, the owner/operator of a new toxic air pollutant source that is likely to increase toxic air pollutant emissions shall demonstrate that emissions from the source are sufficiently low to protect human health and safety from potential carcinogenic and/or other toxic effects.	The substantive requirements of this standard are applicable to remedial actions in the OU, should the remedial action result in the treatment of the soil or debris that contains contaminants of concern identified in the regulation as a toxic air pollutant.
<b>“Ambient Air Quality Standards and Emission Limits for Radionuclides,” WAC 173-480</b>			
“Standards,” WAC 173-480-050	ARAR	Whenever another Federal or state regulation or limitation in effect controls the emission of radionuclides to the ambient air, the more stringent control of emissions shall govern.	The substantive requirements of this standard are applicable in that the more stringent aspect of Federal or state emission limitation is specified as governing.
“Compliance,” WAC 173-480-070(2)	ARAR	Requires that radionuclide emissions compliance shall be determined by calculating the dose to members of the public at the point of maximum annual air concentration in an unrestricted area where any member of the public may be.	The substantive requirements of this standard are applicable to remedial actions involving disturbance or ventilation of radioactively contaminated areas or structures, because airborne radionuclides may be emitted to unrestricted areas where any member of the public may be.

Table B-2. Identification of Potential State Applicable and Relevant or Appropriate Requirements and To Be Considered for the Remedial Action Sites. (8 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
<b>"Radiation Protection – Air Emissions," WAC 246-247</b>			
"General Standards," WAC 246-247-040(1)	ARAR	Requires that emissions of radionuclides to the ambient air from U.S. Department of Energy facilities shall not exceed amounts that would cause any member of the public to receive in any year an effective dose equivalent of 10 mrem/yr.	Substantive requirements of this standard are applicable, because this remedial action may include activities such as decontamination and stabilization of contaminated structures, treatment of sludge, and operation of exhausters and vacuums, each of which may provide airborne emissions of radioactive particulates to unrestricted areas. As a result, requirements limiting emissions apply. This is a risk-based standard for the purposes of protecting human health and the environment.
"Monitoring, Testing, and Quality Assurance," WAC 246-247-075(1)	ARAR	Specifies that radionuclide emission measurements shall be made at all release points that have the potential to discharge radionuclides to the air in quantities that cause an effective dose equivalent in excess of 1% of the standard. The regulation also requires that all radionuclides be measured that could contribute greater than 10% of the potential dose equivalent for a release point.	Substantive requirements of this standard are applicable, because major point-source emissions of radionuclides to the ambient air may result from activities performed during the remedial action, such as decontamination and stabilization of contaminated structures, treatment of sludge, and operation of exhausters and vacuums. This standard exists to ensure compliance with emission standards.
"General Standards," WAC 246-247-040 "BARCT," WAC 246-247-040(3) "ALARACT," WAC 246-247-040(4)	ARAR	Emissions shall be controlled on an ALARA basis, at a minimum, to ensure that emission standards are not exceeded.	Substantive requirements of this standard are applicable, because fugitive, diffuse, and point-source emissions of radionuclides to the ambient air may result from activities performed during the remedial action, such as open-air demolition of contaminated structures, excavation of contaminated soils, and operation of exhausters and vacuums. This standard exists to ensure enhanced compliance with emission standards.

Table B-2. Identification of Potential State Applicable and Relevant or Appropriate Requirements and To Be Considered for the Remedial Action Sites. (8 Pages)

ARAR Citation	ARAR or TBC	Requirement	Rationale for Use
"Monitoring, Testing, and Quality Assurance," WAC 246-247-075(1), (2) WAC 246-247-075(8)	ARAR	Establishes the monitoring, testing, and quality assurance requirements for radioactive air emissions.  Facility (site) emissions resulting from non-point and fugitive sources of airborne radioactive material shall be measured. Measurement techniques may include ambient air measurements, or in-line radiation detector or withdrawal of representative samples from the effluent stream, as determined by the lead agency.	Substantive requirements of this standard are applicable, because fugitive and non-point-source emissions of radionuclides to the ambient air may result from activities performed during the remedial action, such as open-air demolition of contaminated structures and excavation of contaminated soils. This standard exists to ensure compliance with emission standards.

- ALARA = as low as reasonably achievable.  
 ARAR = applicable or relevant and appropriate requirement.  
 CERCLA = *Comprehensive Environmental Response, Compensation, and Liability Act of 1980.*  
 CFR = *Code of Federal Regulations.*  
 OU = operable unit.  
 RCRA = *Resource Conservation and Recovery Act of 1976.*  
 TBC = to be considered.  
 TSD = treatment, storage, and disposal.  
 WAC = *Washington Administrative Code.*

3.	216-T-3	1/16/07

## Notes:

1. Model Group 3 sites require no further data based on an underlying M-15 agreement.
2. Data quality objective decision makers agreed to relocate the following sites to a different operable unit as indicated

below:

- 216-A-2 (Model Group 4): Reassigned from 200-PW-3 to 200-MW-1 (11/28/06)
- 216-T-19 (Model Group 6): Reassigned from 200-PW-1 to 200-TW-1 (11/28/06)
- 216-S-13 (Model Group 2): Reassigned from 200-PW-3 to 200-PW-5 (11/28/06)
- 216-S-14 (Model Group 6): Reassigned from 200-PW-3 to 200-PW-5 to allow analogous relationship with 216-S-14 (11/28/06)
- UPR-200-E-9 (Model Group 6): Reassigned from 200-TW-1 to Model Group 1 (200-MG-2) (12/04/06)
- 216-T-4A (Model Group 5): Reassigned from 200-CW-4 to Model Group 1 (200-MG-1) (11/20/06)
- 216-S-26 (Model Group 6): Reassigned from 200-LW-1 to Model Group 1 (200-MG-1) (12/11/06)
- UPR-200-W-36 reassigned from Model Group 2 and included with 216-S-1&2 (Model Group 4) (11/15/06).

HRR = high-resolution resistivity.

OU = operable unit.

ROD = record of decision.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-S-10P	200-CS-1	5	1			4									No	Existing data are sufficient for decision making.
<b>200-CS-1 Total</b>			<b>1</b>			<b>4</b>				<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>	
216-A-25	200-CW-1	5	1			16	3				2				No	Existing data are sufficient for decision making; however, Ecology indicated stakeholder concern for the overflow area on the northwest edge of the pond; these data would respond to these stakeholder concerns.
216-B-3	200-CW-1	5	1			5					6+				No	These data would augment existing data and support a more detailed evaluation of a partial removal of the hotspot area around test pit location BP-1; these data may influence the remedy selection.
216-B-3A RAD	200-CW-1	5		1				30							No	Existing data are sufficient for decision making.
216-B-3B RAD	200-CW-1	5		1				26							No	Existing data are sufficient for decision making.
216-B-3C RAD	200-CW-1	5		1				21							No	Existing data are sufficient for decision making.
216-S-16P	200-CW-2	5						50			21				No	These activities would provide site-specific data and would allow a more definitive evaluation of partial removal alternative; the data may influence the remedy selection.
216-S-17	200-CW-2	5									15				No	These activities would provide site-specific data and would allow a more definitive evaluation of partial removal alternative; the data may influence the remedy selection.
UPR-200-W-124	200-CW-2	5									3				No	These activities would be contingent on finding contamination at the drive point location near the west end of 216-S-17.
216-T-4A	200-CW-4	5													No	The pond bottom was scraped and placed in Trench 27 of Burial Ground 218-W-2A; this would represent the majority of the small inventory received by the pond; remaining contamination is expected to be minimal and could be addressed through the action at the burial ground; no data collection activities are recommended or considered required for decision making; the waste site will be moved to Model Group 1.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-T-4B	200-CW-4	5									4				No	The pond and trench leading to the pond (within the area of the 218-W3-AE Burial Ground) are expected to have minimal contamination; these activities would provide site-specific data that could be used to support a CERCLA decision for the pond separate from the RCRA decision for the burial ground TSD.
216-U-10	200-CW-5	5		1	10	1	3	5			1 (140 ft)	8	3		No	The borehole would help resolve data quality issues associated with the previous borehole; the test pits would permit a visual inspection and sampling of the organic layer associated with the bottom of the pond that tends to concentrate the contamination; the direct pushes would provide data on the rest of the pond to give a pond-wide data set that could be used to address stakeholder concerns and uncertainties on inventory.
216-U-11	200-CW-5	5						2				14			No	These data would augment existing data and support a more detailed evaluation of a partial removal alternative; the data may influence the remedy selection
<b>200-CW-1 Total (M-015-38B, 05/31/2009)</b>			<b>2</b>	<b>4</b>	<b>10</b>	<b>22</b>	<b>6</b>	<b>134</b>		<b>0</b>	<b>1</b>	<b>73</b>	<b>3</b>	<b>0</b>	<b>0</b>	
216-Z-11	200-CW-5	3	1		20		2								No	Early agreement was reached that supplemental data are not required.
216-Z-19	200-CW-5	3						272							No	Early agreement was reached that supplemental data are not required.
216-Z-1D	200-CW-5	3						90							No	Early agreement was reached that supplemental data are not required.
216-Z-20	200-CW-5	3													No	Early agreement was reached that supplemental data are not required.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-A-30	200-SC-1	6							1						Yes	The analogous relationship with 216-U-10 is somewhat uncertain. Inventory information would suggest potential for groundwater impacts associated with chromium, fluoride, and/or nitrate. HRR would support evaluation of the lateral extent of potential elevated conductivity and a deep borehole would provide site-specific data on nature and vertical extent and correlation data for the HRR survey results. The data from the 216-A-30 borehole would be used as analogous for 216-A-37-2 and 216-A-6 and associated unplanned releases because 216-A-37-2 and 216-A-6 received the same waste as 216-A-30. 216-A-6 was ultimately replaced by 216-A-30 and 216-A-37-2 replaced 216-A-30.
216-A-37-2	200-SC-1	6											299-E25-21, 299-E25-23, 299-E25-24	Yes	Data collected from 216-A-30 will be used to evaluate this trench; logging of existing wells will provide opportunistic site-specific information on contaminant nature and distribution	
216-A-6	200-SC-1	6												Yes (opportunistic)	Existing data and data from 216-A-30 will be used to evaluate this site	
216-B-55	200-SC-1	6									6		299-E28-13	No	This crib is assigned to 216-U-10, which has a larger inventory of several constituents. While the analogous relationship with 216-U-10 would bound the decision process, supplemental data at 216-B-55 may permit a stronger analysis of no action and MESC/MNA/IC alternatives and may permit lesser alternative than the analogous evaluation. Supplemental data would provide information on the nature and extent of contamination; because the crib is large, the supplemental data would allow assessment of partial removal alternative and permit a more accurate evaluation of contaminant volume and cost.	

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-S-5	200-SC-1	6					1								Yes	Existing information is sufficient for decision making for the shallow zone; HRR would provide information on elevated conductivity that may be associated with deeper contamination; the borehole at 216-S-6 would provide information to validate the HRR and to evaluate protection of groundwater at 216-S-5 as well.
216-S-6	200-SC-1	6													Yes	The analogous relationship between 216-U-10 (representative site) and 216-S-6 is somewhat uncertain; while inventory, geophysical logs, and analogous relationships may support shallow vadose zone decision making, HRR surveys would provide indication of deeper zones of elevated conductivity that may be associated with contamination. A shallow borehole would help correlate with the HRR, would provide information on pore water contamination, and would support the protection of groundwater evaluation for both the 216-S-6 and 216-S-5 Cribs. Supplemental data would provide site-specific information on remaining inventory of uranium and nitrate in the soil column that may impact groundwater.
216-T-36	200-SC-1	6							Yes	1*	TBD				Complete	Uncertainty in the inventory would be resolved by a borehole at this crib; information on nature and vertical extent would be used to better understand the current groundwater plume in the area and the protection of groundwater from contaminants remaining in the vadose zone
UPR-200-E-19	200-SC-1	6													Yes (opportunistic)	See 216-A-6; this unplanned release site is associated with and will be addressed with 216-A-6
UPR-200-E-21	200-SC-1	6													Yes (opportunistic)	See 216-A-6; this unplanned release site is associated with and will be addressed with 216-A-6.
UPR-200-E-29	200-SC-1	6													Yes (opportunistic)	See 216-A-6; this unplanned release site is associated with and will be addressed with 216-A-6.

			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR			
<b>200-CW-5 Total (M-015-40D, 4/30/2008)</b>			<b>1</b>		<b>20</b>		<b>3</b>	<b>362</b>	<b>1</b>				<b>2</b>	<b>2</b>	<b>6</b>	<b>0</b>	<b>4</b>	<b>8</b>	
216-T-27	200-LW-1	2					1										299-W14-53	Yes	Newer log in well 299-W14-53 would provide information on contaminant movement; HRR would provide information on deeper contaminants that may be associated with groundwater plume in area and would help resolve modeling issues for the area; analogous relationship with 216-T-26 and 216-T-28 is sufficient for decision making.
216-T-28	200-LW-1	2	1				5											Yes	See 216-T-27.
216-T-34	200-LW-1	6												1				Yes	Existing data and inventory support decision making; however, the representative site (216-Z-7) for the 216-T-34 Crib has greater Cs-137, plutonium, and uranium inventory. HRR would provide information to address uncertainty on groundwater protection due to nitrate inventory; shallow borehole would provide information on nature of contamination, including plutonium, in the shallow zone to support risk assessment; data also would support evaluation at 216-T-35 as an analogous site to 216-T-34.
216-T-35	200-LW-1	6															299-W11-18	Yes	Existing geophysical logging data and supplemental data collected from 216-T-34 will be used to support decision making at 216-T-35.
216-A-15	200-LW-2	2							Yes								Vent riser, if possible	Complete	Low volume and inventory; geophysical logging is opportunistic method to gain site-specific data; decision can be made on analogous relationships and inventory.
216-B-10A	200-LW-2	2													1			Yes (opportunistic)	The 216-B-10A site received a lot of effluent with a small inventory; however, site-specific data may help support evaluation and selection of a lesser alternative, such as MESC/MNA/IC, and would provide better data for balancing the decision making between leave in place and remove alternatives.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data							Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	HRR	
216-B-10B	200-LW-2	2													Yes (opportunistic)	Received only 28,000 L; analogous to 216-B-10A; so data from 216-B-10A would support decision making at 216-B-10B
216-B-6	200-LW-2	2								1*					Yes	Uncertainty associated with the current groundwater contamination and the potential for groundwater impacts due to vadose zone contamination are not adequately addressed by the analogous relationship, because the assigned representative site does not have a similar chromium inventory. A monitoring well is needed near this site; this well will provide vadose zone data that can be used to support the groundwater protection evaluation in the FS. HRR will help locate the well and will provide information on the lateral extent.
216-S-20	200-LW-2	2	1				4								No	Existing data are sufficient to support decision making.
216-S-26	200-LW-2	6													No	Site is identified in preliminary FS as an RTD site; no supplemental data are required to support RTD determination.
216-T-2	200-LW-2	2													No	Analogous relationship is sufficient for decision making; received 6,000 m <sup>3</sup> of waste and a small inventory.
216-T-8	200-LW-2	6												2	No	This crib is preliminarily assigned to 216-T-28, which has a larger inventory of several constituents. While the analogous relationship with 216-T-26 would bound the decision process, supplemental data at 216-T-8 may permit a stronger analysis of no action and MESC/MNA/IC alternatives and may permit lesser alternative than the analogous evaluation.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-Z-16	200-LW-2	6					1								Yes	SIM inventory indicates a large volume of fluoride went to this crib; the impacts to groundwater associated with fluoride are uncertain; HRR would provide an indication of potential elevated conductivity that may be associated with vadose zone contamination and elevated moisture; based on the HRR, additional data collection activities may be required to assess the impacts.
216-Z-17	200-LW-2	6											299-W15-204 moisture log		No	This site will be evaluated based on data collected at 216-Z-16, which received a similar inventory of fluoride.
216-Z-7	200-LW-2	4	1		6		7						Neutron in W15-62, -63, -64, -76, -77, and -78		Yes	Existing data are sufficient for decision making; supplemental data further define extent and help refine cost estimates related to high plutonium removal and disposal.
<b>200-LW-1/200-LW-2 Total (M-015-46B,</b>			<b>3</b>		<b>6</b>		<b>18</b>						<b>9</b>	<b>9</b>		
200-E-102	200-MW-1	4							Yes			1			Complete	200-E-102 is analogous to 216-A-4 in terms of contaminants because it was used to dispose of soils contaminated when 216-A-4 plugged. Groundwater impacts are not expected to be significant because the waste discharged was soils. Therefore, the analogous relationship is sufficient for decision making; supplemental data support evaluation of HRR in area south of PUREX and provide information on the use and depth of investigation of hydraulic hammer south of PUREX.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities			
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR		
216-A-2	200-PW-3	4					1			Yes	1			1			Complete	216-A-2 Crib is very near to and was constructed around the same time as 216-A-4. Investigation activities initiated at 216-A-4 identified uncertainty associated with unexpectedly high contamination that was not in line with the inventory information. Based on the uncertainty in the contamination at 216-A-4 and its proximity to 216-A-2, site-specific supplemental data from 216-A-2 will help reduce potential uncertainty at that site associated with the nature of contamination and will provide a better understanding of crib risks than the analogous relationship to either 216-A-4 or 216-A-8 (analogous assignment has not been made for 216-A-2, but 216-A-4 and 216-A-8 are likely representative sites for 216-A-2); supplemental data would be considered acceleration of confirmatory sampling. HRR and data from 216-A-4 will provide additional information on extent of contamination for the area south of PUREX and will be used to help evaluate alternatives at 216-A-2 as well as 216-A-4.
216-A-21	200-MW-1	6					1			Yes				1			Complete	Analogous relationship with 216-A-4 is bounding for 216-A-21, which was built to replace 216-A-4. Because of the uncertainty at 216-A-4, a direct push at 216-A-21 will provide site-specific information to better define the relationship with 216-A-4.
216-A-27	200-MW-1	6					2			Yes							Complete	Existing information and analogous relationship are sufficient to support decision making; this site is the replacement crib for 216-A-21, which replaced 216-A-4.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities		
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR	
216-A-4	200-MW-1	4		1	1		1			Yes	1					Complete	Data are needed with depth to meet requirements of existing work plan. Samples have been collected in the 0 to 15-ft zone; these data are augmented with geophysical logging data. No additional data are needed for this zone. The SAP for the step-off borehole at 216-A-4 specifies additional data collection down the borehole that will support future modeling efforts and provide detailed assessment of contamination in pore water with depth and its potential impact on groundwater. The need for additional data beyond the 216-A-4 borehole will be assessed once the data are available for review. Data on plutonium extent exist from the sampling and logging already conducted at the site. Additional information will be gained from the step-off borehole and passive neutron logging will be attempted in the 299-E24-54 borehole in the northeast corner of the crib. These data will provide an understanding of the distribution of the plutonium. Additional needs will be assessed once these data are collected.
216-B-4	200-MW-1	2												Log reverse well if possible	Yes (opportunistic)	Low volume and inventory; opportunistic method to gain site-specific data; decision can be made on analogous relationships and inventory	
216-C-2	200-MW-1	2		1 (sediment sample from reverse well)											Yes (opportunistic)	Existing data are sufficient to support decision making	
<b>200-MW-1 Total (M-015-44B, 12/31/2008)</b>				<b>2</b>	<b>1</b>		<b>4</b>			<b>4</b>	<b>2</b>	<b>0</b>	<b>2</b>	<b>0</b>	<b>1</b>	<b>2</b>	
216-Z-1&2	200-PW-1	4														No	Existing data sufficient for decision making.
216-Z-12	200-PW-1	4	3				9									No	Existing data sufficient for decision making; supplemental data further defines extent and helps refine understanding of potential impacts to groundwater

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-Z-18	200-PW-1	4					4								No	Existing data sufficient for decision making.
216-Z-1A	200-PW-1	4	2	14	15+		3								No	Existing data sufficient for decision making.
216-Z-3	200-PW-1	4					2								No	Existing data sufficient for decision making.
216-Z-9	200-PW-1	4	7	2	15+		3								No	Existing data sufficient for decision making.
241-Z-361	200-PW-1	4							Sludge						No	Sludge has been sampled; minimal likelihood of leaks; no supplemental data needed.
UPR-200-W-110	200-PW-1	3													No	Early agreement that supplemental data are not required.
216-A-24	200-PW-3	6					23								Yes	The relationship with 216-A-8, a representative site for this OU group, is strong enough to support decision making at 216-A-24. Inventories and types of contaminants are similar and the 216-A-24 Crib was used to replace the 216-A-8 Crib. Information on nature and extent of contamination can be assessed using the information from the 216-A-8 Crib. To augment the understanding of deeper contamination at 216-A-8 and 216-A-24, along with other sites in the same area, HRR is proposed for evaluating the presence of potential deeper zones of elevated conductivity.
216-A-31	200-PW-3	2								Yes					Complete	Very low volume and inventory received.
216-A-7	200-PW-3	6											299-E25-54	Yes	Uncertainty exists in the organic inventory, the current concentration, and potential impact on groundwater. This site has a large Cs-137 inventory as well as the organic, which is a unique combination. This site is similar to 216-A-8 in inventory, but did receive a different waste stream. The impacts on contaminant distribution should be investigated to support the remedial decision making. Because well 299-E25-54 is located within the site boundaries, logging this well would provide site-specific spectral gamma data in the shallow zone.	

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-A-8	200-PW-3	6	1		5		6								Yes	Existing data are sufficient to support decision making. Data on the nature of contamination were collected during the RI from the borehole; information on the extent of organics was evaluated through vapor sampling from new and existing holes. Information on the extent of Cs-137 and other gamma emitters also was collected through geophysical logging activities. HRR surveys are being proposed by both groundwater and waste sites for this area. HRR surveys will provide information on zones of elevated conductivity, if present, that may be indicative of potential impacts to groundwater. The HRR can be evaluated using the existing data from the borehole at 216-A-8.
UPR-200-E-56	200-PW-3	6													No	See 216-A-24; site is associated with and will be addressed by 216-A-24
216-Z-10	200-PW-6	7													No	Inventory and analogous data could be used to support decision making. Plutonium and americium are not expected to impact groundwater and the contamination is too deep for surface exposure by humans or biota. Because of low inventory and site type (i.e., reverse well with 6-in. diameter), potential for intrusion is very low.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-Z-5	200-PW-6	2					6								No	The analogous site relationship with 216-Z-7 is strong because the waste stream that went to 216-Z-5 was diverted to 216-Z-7; therefore, the analogous site relationship supports decision making. However, supplemental data to assess the plutonium concentration could influence the remedial action evaluation, especially the cost estimate. According to SIM, 216-Z-7 received 504.8 g of Pu-239 and 39.97 g Pu-240 versus the 29.63 g Pu-239 and 1.999 g Pu-240 for 216-Z-5. The maximum concentration found at 216-Z-7 was 470,000 pCi/g Pu-239/240. Based on these ratios, Pu concentrations at 216-Z-5 should be an order of magnitude less than 216-Z-7; therefore, concentrations may be below 100 nCi/g, which can strongly influence decision making.
216-Z-8	200-PW-6	4	3				7								No	Small site; contaminants to ~30 ft; no supplemental data needed for decision making
241-Z-8	200-PW-6	4						Sludge							No	Sludge has been sampled; minimal likelihood of leaks; no supplemental data needed
<b>200-PW-1 Total (M-015-45B, 9/30/2007)</b>			<b>16</b>	<b>16</b>	<b>35</b>		<b>63</b>	<b>2</b>	<b>2</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>1</b>	<b>3</b>	
216-A-10	200-PW-2	2	1		5		4		Partial						Yes	Existing data from remedial investigation is sufficient for decision making for the upper vadose zone; however, the HRR south of PUREX indicates potentially high conductivity in the area of the 216-A-10 Crib; HRR over the rest of the crib would provide better understanding of the distribution of the conductivity plume; data from 216-A-4 and A-5 Cribs would be used in conjunction with the 216-A-10 Crib data to better understand potential for deep contamination and associated risks to groundwater.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-A-19	200-PW-2	6	1												Yes	Existing information are sufficient to support decision making. HRR surveys are proposed for the 216-A-8 and 216-A-24 sites; these surveys would cover 216-A-19 and would help reduce uncertainty associated with deeper vadose zone contamination. Based on the preferred alternative of RTD, lateral extent can be determined during design or through the observational approach. Supplemental data would not likely change the preferred alternative.
216-A-36A	200-PW-2	2							Yes						Complete	HRR already run over the northern part of the 216-B-36A&B Cribs; HRR would be completed over the entire crib area to define the outer limit of the conductivity plume south of PUREX; the need for additional data will be assessed following completion of the 216-A-4 and 216-A-2 boreholes.
216-A-36B	200-PW-2	2	1				3		Partial						Yes	Existing data from remedial investigation are sufficient for decision making for the upper vadose zone; however, the HRR south of PUREX indicates potentially high conductivity in the area of the A-36A&B Cribs; HRR has been run over a portion of the 216-A-36A&B cribs; HRR over the rest of the crib area would provide better understanding of the distribution of the conductivity plume; see 216-A-36A

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data							Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	HRR	
216-A-5	200-PW-2	2					4		Yes	1		1			Complete	Because of the contamination uncertainties identified at the 216-A-4 Crib and the apparent contribution by 216-A-5 to the elevated conductivity plume identified by HRR surveys on the western side of the south of PUREX area, supplemental data would help provide a better understanding of deep zone contaminants and potential to impact groundwater. These data also would support validation of the HRR results and development of a south of PUREX conceptual site model to support all the FS efforts in this area. A drive point will be installed before the borehole to obtain spectral gamma information to support health and safety and radiological control planning, and to provide some additional data on extent.
216-B-12	200-PW-2	2	1				3			1*					Yes	The reported inventory for total uranium is 15,112 kg and for nitrate is 2.8 million kg. This inventory could present a substantial risk to groundwater; however, few groundwater monitoring wells are available for analysis. The data collected during the remedial investigation are not reflective of the inventory, so an uncertainty exists between inventory and sampling data. The need for a groundwater monitoring well in the area has been identified through the 200-BP-5 OU DQO efforts. Opportunistic data collection associated with a planned groundwater monitoring well, including assessment of pore water contamination in the vadose zone, will be used to augment the FS evaluation of protection of groundwater. HRR surveys will be used to evaluate extent and to help locate the monitoring well. The results from the borehole will help resolve the inconsistencies between the existing borehole data and the inventory information.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-C-1	200-PW-2	6								1*					Yes	This site has one of the largest identified chromium inventories; the 216-C-1 chromium inventory is an order of magnitude higher than the chromium inventory of its representative site (216-A-10). Additional data on nature and extent of potential vadose plumes of mobile contaminants is needed to assess protection of groundwater in this area. The combination of HRR and a deep borehole will provide information on nature and on vertical and lateral extent, which will support a stronger modeling effort and risk assessment in the RI/FS documents. Analogous relationships and inventory are sufficient to support decision making on the shallow contamination.
216-S-1&2	200-PW-2	4		11			1			1		2		W22-67	Yes	A large inventory of mobile contaminants was discharged to these cribs. An assessment of the extent of deeper contaminants is needed to support protection of groundwater evaluation. HRR will give an indication of the presence of a conductivity plume that likely will be associated with the nitrate and other mobile constituents. A follow-on DQO process to evaluate the need for further characterization needs based on the results of the HRR will be conducted as needed. The inventory of plutonium discharged to these cribs may result in concentrations above 100 nCi/g. This is an uncertainty that can influence the evaluation of alternatives. Determining the extent of the plutonium contamination will support a better evaluation of protectiveness, disposal options, and costs. Three direct pushes are proposed to evaluate the extent of plutonium at these cribs.
216-S-7	200-PW-2	2	1				5								No	Existing data are sufficient to support decision making.
UPR-200-W-36	200-PW-2	2													Yes (opportunistic)	Included with 216-S-1&2 in Model Group 4.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	
216-A-37-1	200-PW-4	6	1				3							Yes	Existing data are sufficient for decision making.
216-A-45	200-PW-4	2					3						299-E17-12, -13, -53, and -54	Yes	Very low volume and inventory received; logs would provide site-specific information for remedial alternative evaluation.
216-S-23	200-PW-4	2					4							No	Site received large volume with very low inventory;
<b>200-PW-2/200-PW-4 Total (M-015-43D,</b>			<b>6</b>	<b>11</b>	<b>5</b>		<b>30</b>		<b>1</b>	<b>4</b>	<b>0</b>	<b>3</b>	<b>0</b>	<b>5</b>	<b>9</b>
216-B-11A&B	200-PW-5	6					2							Yes*	Existing data are sufficient for decision making.
216-B-50	200-PW-5	2		3										Yes*	Part of BY Cribs; see 216-B-43.
216-B-57	200-PW-5	2	1	2										Yes*	Site is covered with Hanford Barrier; data collected under 200-BP-1 and as part of barrier monitoring are sufficient for decision making.
216-B-62	200-PW-5	6					8						299-E28-85, 299-E28-86, 299-E28-87, 299-E28-88, 299-E28-90; 299-E28-18 and 299-E28-21, if possible	No	Existing information in concert with logging of existing wells provides sufficient data for decision making as Cs-137 is the major contaminant at this site; this site is directly analogous to 216-B-12, which was characterized under 200-PW-2/4 Work Plan.
216-S-13	200-PW-3	2								1			299-W22-21	Yes	Analogous relationships with other sites (such as 216-S-7 or other 200-PW-1/3/6 sites) and inventory data would support decision making; however, uncertainty exists in the chromium data between current SIM inventory and inventory data from past estimates. Supplemental data could help alleviate the uncertainty and would be used to support a better evaluation of protection of groundwater, especially for the chromium.
216-S-14	200-PW-3	6												No	Existing information and data from 216-S-13 borehole will be used to evaluate waste site; hexone was the main contaminant and is not expected to remain in the soils; 216-S-13 also received hexone along with other contaminants.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-S-21	200-PW-5	2									1			299-W23-63	No	The analogous relationship and inventory data are sufficient to support decision making; however, supplemental data may support a lesser alternative (such as MESC/MNA/IC). Inventory data do not suggest groundwater protection issue. Cesium-137 is the main contaminant identified in the SIM inventory. Nearby borehole logging indicates background levels for gamma emitters. Logging the existing borehole in the crib and sampling at the crib bottom would provide confirmatory data that may support stronger evaluation and potential selection of a lesser remedy.
216-S-9	200-PW-5	6												299-W22-25, 299-W22-26	Yes	Existing information is sufficient for decision making for the shallow zone; HRR would provide information on elevated conductivity in the deeper vadose zone that may be associated with nitrate contamination; geophysical logging of existing boreholes would provide additional data on extent of contamination.
216-B-42	200-TW-1	6					1								Yes*	A borehole at this site would reduce uncertainty associated with differences in waste streams between 216-B-42 and 216-B-38; depth of borehole to be dependent on HRR results.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-B-43	200-TW-1	2	1	2			1								Yes*	The upper vadose zone was extensively investigated; data on the deeper vadose zone were collected but were not as extensive. Existing data are likely sufficient to support decision making for the waste sites; however, the groundwater in the area has some uncertainties associated with increasing contamination levels. To obtain a better understanding of the deep vadose zone and the groundwater, supplemental information on deep vadose zone nature and extent would reduce uncertainty. HRR will supply extent information and will help support placement of boreholes that will be used to obtain deep vadose zone information on nature and extent and provide groundwater monitoring points. The HRR activities were initiated in the fall of 2006. The data from these activities will be used to augment the evaluation of this set of cribs in the FS process. These data would constitute an acceleration of confirmatory sampling for the BY Cribs
216-B-44	200-TW-1	2		3			2								Yes*	Part of BY Cribs; see 216-B-43.
216-B-45	200-TW-1	2		3			2								Yes*	Part of BY Cribs; see 216-B-43.
216-B-46	200-TW-1	2		3			2								Yes*	Part of BY Cribs; see 216-B-43.
216-B-47	200-TW-1	2		3			1								Yes*	Part of BY Cribs; see 216-B-43.
216-B-48	200-TW-1	2		3			1								Yes*	Part of BY Cribs; see 216-B-43.
216-B-49	200-TW-1	2	1	2											Yes*	Part of BY Cribs; see 216-B-43.
216-BY-201	200-TW-1	7													Yes*	Existing data are sufficient to support decision making.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-T-18	200-TW-1	4					1					4			Yes	The analogous relationship with 216-T-26 is sufficient to support decision making. Inventory does not imply significant groundwater risks; however, opportunity exists to extend the HRR proposed for 216-T-26, 216-T-27, and 216-T-28 to cover 216-T-18. This would provide confirmatory information on the deeper vadose zone for 216-T-18. In addition, 216-T-18 only received a small volume, which would not indicate a substantial threat to groundwater. Supplemental information on the nature and extent of plutonium may provide a stronger evaluation of protectiveness, disposal options, and cost. The direct pushes would help establish the extent of plutonium at the crib. These data also may permit selection of a lesser or different alternative. These data collection activities would constitute accelerated confirmatory sampling activities.
216-T-19	200-PW-1	6					1			1					Yes	Supplemental data on the nature and extent of contamination are needed to address uncertainties associated with protection of groundwater and with unexpected contamination from a nearby borehole (found during drilling); HRR will provide extent of elevated conductivity and borehole will provide information on nature of contamination in the crib and in the pore water.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-T-26	200-TW-1	2	1				2								Yes	Existing data are sufficient for decision making; however, supplemental data may provide information on lateral extent and support a stronger basis for protection of groundwater evaluation. HRR surveys would provide information on lateral extent of potential elevated conductivity plume. The nature of the conductivity plume would be assessed based on the existing borehole data. Because well 299-W14-53 was logged before waste discharge, a new geophysical log would provide information on the impacts of the waste discharge on vadose contaminant concentrations.
UPR-200-E-9	200-TW-1	6													Yes* (Opportunistic)	Regulators agreed no supplemental data needed to support decision making; requested site be moved to 200-MG-2.
<b>200-TW-1/200-PW-5 Total (M-015-42D,</b>			<b>4</b>	<b>24</b>			<b>24</b>		<b>2</b>	<b>5</b>	<b>0</b>	<b>5</b>	<b>0</b>	<b>11</b>	<b>18</b>	
200-E-45	200-TW-2	7													Yes*	Site is associated with 216-B-8 and will be addressed with 216-B-8; no supplemental data are needed for 200-E-45.
200-W-52	200-TW-2	4							Yes						Complete	Site is associated with 216-T-7; supplemental activities are identified under 216-T-7.
216-B-35	200-TW-2	6					1								Yes*	See 216-B-38; existing information and HRR would provide sufficient information on nature and extent of contamination.
216-B-36	200-TW-2	6					2								Yes*	See 216-B-38; existing information and HRR would provide sufficient information on nature and extent of contamination.
216-B-37	200-TW-2	6					3								Yes*	See 216-B-38; existing information and HRR would provide sufficient information on nature and extent of contamination.
216-B-38	200-TW-2	6	1		5		2								Yes*	See 216-B-38; existing information and HRR would provide sufficient information on nature and extent of contamination.
216-B-39	200-TW-2	6													Yes*	See 216-B-38; existing information and HRR would provide sufficient information on nature and extent of contamination.
216-B-40	200-TW-2	6													Yes*	See 216-B-38; existing information and HRR would provide sufficient information on nature and extent of contamination.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-B-41	200-TW-2	6					1								Yes*	See 216-B-38; existing information and HRR would provide sufficient information on nature and extent of contamination.
216-B-5	200-TW-2	7													No	Existing data are sufficient to support decision making.
216-B-7A&B	200-TW-2	4	1				5				3		E33-18		Yes*	The extent of plutonium at concentrations above 100 nCi/g is significant to the decision process in terms of balancing costs for removal and disposal against costs for capping and long-term maintenance and for balancing worker risk against long-term risks. Logs in nearby existing wells show Cs-137 has spread beyond the waste-site boundaries. Supplemental data collection activities would define the extent of plutonium movement and provide a better understanding of plutonium distribution and volume, especially in relation to concentrations above 100 nCi/g. HRR would provide information on potential elevated conductivity, which may be indicative of elevated moisture and associated contamination. This information would support an understanding of the extent of deeper constituents.
216-B-8	200-TW-2	6					7			2*		1			Yes*	Groundwater wells being planned near 216 B-8 will be sampled to obtain vadose zone information; a direct push will provide information on the extent of contamination; the HRR information will help locate both the groundwater wells and the direct push.
216-B-9	200-TW-2	6					12								No	Existing data are sufficient for decision making.
216-T-14	200-TW-2	6					1		Yes						Complete	See 216-T-15.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-T-15	200-TW-2	6							Yes			4			Complete	Existing logging data provide some information on the extent of the shallow contamination. Direct pushes in the 216-T-15 Trench would augment the existing information and provide a stronger analysis of the partial removal alternative. Recently drilled groundwater wells will provide information on the deeper contamination; existing HRR surveys will be used in coordination with other data sources to enhance the understanding of the contamination problem at the 216-T-14 through 216-T-17 trenches.
216-T-16	200-TW-2	6							Yes						Complete	See 216-T-15.
216-T-17	200-TW-2	6							Yes						Complete	See 216-T-15.
216-T-21	200-TW-2	6					1								Yes	Existing logging data provide information on the extent of the shallow contamination. The analogous relationship to the 216-T-15 and 216-B-38 waste sites would be used in combination with the HRR to evaluate the 216-T-21 through 216-T-25 trenches.
216-T-22	200-TW-2	6					2								Yes	See 216-T-21.
216-T-23	200-TW-2	6					1								Yes	See 216-T-21.
216-T-24	200-TW-2	6					2								Yes	See 216-T-21.
216-T-25	200-TW-2	6					1								Yes	See 216-T-21.
216-T-3	200-TW-2	7								1					Yes (opportunistic)	Existing data for this site are limited; a deep borehole would provide information on the plutonium concentrations and would support a better risk assessment and evaluation of protectiveness.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-T-32	200-TW-2	4					1		Yes			4			Complete	The uncertainty associated with the plutonium inventory and resulting soil concentrations could impact the remedial alternative and should be resolved through supplemental data collection. The presence of high plutonium may influence the evaluation of remedial alternatives, especially in terms of protectiveness, disposal options, and cost. Identifying the plutonium concentrations also may permit assessment and use of a lesser alternative if concentrations are lower than the associated representative site. The uncertainty associated with the elevated conductivity plume in this area will be addressed through a borehole at 216-T-7; data collected at 216-T-7 will include an assessment of pore water contamination to support the protection of groundwater evaluation. Based on the results of that borehole, a follow-on DQO process may be conducted if uncertainties remain.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities	
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR
216-T-5	200-TW-2	4					2		Yes			4			Complete	Supplemental data will help resolve uncertainties associated with the nature of the plutonium contamination near the bottom of the crib structure and below, and will support evaluation of a broader range of alternatives, including disposal options. HRR data do not indicate a conductivity plume beneath this site. No supplemental data collection activities are required at this time for this crib. Data with depth in the area will be collected through a boring at 216-T-7, which will provide data for use in assessing the deep vadose zone in the area, including at 216-T-5. The 216-T-7 data will be evaluated and if needed, a follow-on DQO for the area will be conducted. The extent of contamination at the crib is defined well enough by the analogous site approach, by the small size of the crib, by geophysical logging of nearby wells, and by the proposed boring. No supplemental data on extent are required to support decision making.
216-T-6	200-TW-2	4					15					4			Yes	Analogous relationships and inventory can be used for decision making. However, more refined data on plutonium concentrations could reduce uncertainty in evaluation of disposal options and associated costs. Because of the large nitrate inventory, HRR would help resolve extent of deeper mobile contaminants.

Table C-2. Supplemental Data Collection Activities by Operable Unit - Model Groups 2 through 7. (26 Pages)

Waste Site	Operable Unit	Model #	Existing Data						Proposed Supplemental Data Collection Activities						Rationale for Proposed Supplemental Data Collection Activities		
			Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes	Surface Sampling	HRR	Deep Boreholes	Shallow Boreholes	Drive Points	Test Pits	Geophysical Logging of Existing Boreholes		HRR	
216-T-7	200-TW-2	4					1			Yes	1*	1	1			Complete	The plutonium concentration is uncertain and should be resolved to support a stronger evaluation of protectiveness, disposal options, and cost. Eight borings in 216-T-7 and 200-W-52 have recently been geophysically logged; however, the data from these logs were not available for this review. Analysis of these logging results should be conducted before further activities at the crib and tile field and to locate supplemental data collection activities. A borehole to groundwater would provide site-specific information for the waste sites and would provide additional information on the nature of the conductivity plume. A combined borehole to address waste site and groundwater needs may be an opportunity but would need to be drilled adjacent to the waste sites. If so, a shallow borehole through the waste site (located based on the results of the geophysical logging of the eight borings) would provide site-specific information on the plutonium concentrations.
241-B-361	200-TW-2	4					2	Sludge								No	Sludge has been sampled; minimal likelihood of leaks; no supplemental data needed.
241-T-361	200-TW-2	4					1	Sludge								Complete	Sludge has been sampled; minimal likelihood of leaks; no supplemental data needed.
<b>200-TW-2 Total (M-015-42E, 12/31/2011)</b>			<b>2</b>		<b>5</b>		<b>63</b>	<b>2</b>		<b>15</b>	<b>4</b>	<b>1</b>	<b>21</b>	<b>0</b>	<b>1</b>	<b>17</b>	
UPR-200-E-144	200-UR-1	4					8				(See 216-B-7A&B)					No	Consolidated material over 216-B-7A and other nearby sites; only minor contamination; no supplemental data required.
UPR-200-W-166	200-UR-1	6														No	Unplanned release associated with the 216-T-14 through 216-T-17 Crib; UPR will be addressed with the cribs, so no supplemental data required.

## 1.0 INTRODUCTION

This Volume II of the Remedial Investigation/Feasibility Study (RI/FS) Work Plan consists of addenda that contain site-specific field-sampling plans (SSSP) for the 200 Areas Central Plateau waste sites that will be investigated under this Work Plan. The overall Work Plan scope includes supplemental investigation activities for the 200 Areas Central Plateau waste sites listed in Volume I, Table 1-2 for which the U.S. Department of Energy, U.S. Environmental Protection Agency, and Washington State Department of Ecology (the Tri-Parties), through the data quality objective process (Volume I, Appendix C), have identified a need for additional data to reach a final record of decision. Each Volume II addendum may include one or more SSSPs, each of which can address one or more waste sites. The SSSPs will contain the detailed site-specific sampling strategies, such as number and location of samples, analytes, and sampling and analytical methods. These SSSPs, along with the Work Plan Volume I, Appendix A SAP (which provides the general elements for satisfying data needs and includes the quality assurance project plan, overarching field sampling plan, and health and safety plan), provide the necessary information and approvals for supplemental data collection at these specified sites.

Generally, an addendum will address waste sites that are regulated by one lead agency, either the Washington State Department of Ecology or the U.S. Environmental Protection Agency, depending on which is the lead agency for the operable unit in which the waste site resides. An addendum will require approval by DOE, Richland Operations Office (RL) and the lead agency. Approval will be documented by RL and the agency signature on the addendum approval page. The addendum approval process will be similar to that for primary documents under the *Hanford Federal Facility Agreement and Consent Order* (Ecology et al. 1989a) (Tri-Party Agreement) and will follow the document review and comment requirements set forth in Section 9.2 of the *Hanford Federal Facility Agreement and Consent Order Action Plan* (Ecology et al. 1989b).

Volume II, Revision 0, includes Addendum 1 and approval of Revision 0 constitutes Addendum 1 approval. Addendum 1 contains SSSPs for supplemental investigation of some of the waste sites in source operable units that have near-term (fiscal year 2007 and fiscal year 2008) Tri-Party Agreement milestones to submit feasibility studies. This near-term scope is identified in Volume I, Table 1-2, and includes waste sites addressed under the following documents:

- Volume II, Addendum 1 (216-S-5, 216-S-6, 216-T-36, 216-B-55, 216-A-37-2, and 216-A-30 Cribs)
- DOE/RL 2006-47, *Sampling and Analysis Plan for Additional Remedial Investigation Activities at the 216-A-4 Crib and the 200-E-102 Trench* (216-A-4 Crib and 200-E-102 Trench)

- 1 • DOE/RL-2006-57, *Sampling and Analysis Plan for Supplemental Remedial Investigation*  
2 *Activities at Model Group-5, Large Area Ponds, Waste Sites (Model Group 5 Large*  
3 *Area Ponds)*
- 4 • DOE/RL 2006-77, in work, *Sampling and Analysis Plan for Additional Remedial*  
5 *Investigation Activities at the 216-A-2 Crib (216-A-2 and 216-A-21 Crib).*
- 6 Future Volume II addenda will be developed to provide SSSPs for the remaining waste sites to  
7 be investigated under this Work Plan. As SSSPs are developed and approved, they will be  
8 incorporated into Volume II in accordance with Volume I, Chapter 4.0 and this chapter.  
9 Approved addenda can be added to Volume II at any time by updating the Volume II table of  
10 contents without formal Work Plan revision.

**AD1-1.0 INTRODUCTION**

1  
2 Addendum 1 of Work Plan Volume II contains the site-specific field sampling plans (SSSP) for  
3 the 216-S-5, 216-S-6, 216-T-36, 216-B-55, 216-A-37-2, and 216-A-30 Cribs. The SSSPs in this  
4 addendum provide site-specific information regarding the waste sites conceptual model, data  
5 needs, data-collection strategy, and associated analytical and quality control requirements arrived  
6 at during the agency data quality objectives (DQO) process as documented in the data-needs  
7 priority summary tables (Volume I, Appendix C). Together with the elements of the overall SAP  
8 (Volume I, Appendix A), the SSSPs presented in Chapters 2.0 through 6.0 of this addendum  
9 complete the Sampling and Analysis Plan for these waste sites.

Figure AD-3. 216-S-5 Crib  
Conceptual Model and Data Summary.

200-SC-1 Operable Unit  
Waste Type: Steam Condensate

# 216-S-5 Crib

Model Group 6  
200-W Ponds Zone

## History

216-S-5 Crib is a liquid waste disposal site that received process cooling water and REDOX steam condensate from the 202-S Building. The waste water was acidic. The structure was allowed to overflow for some months in 1956 and surrounding contamination ranged from 100 millirad/hr to 17 rad/hr.

**CONSTRUCTION:** A square pit 210 ft by 210 ft by 15 ft deep, filled with gravel and two corrugated perforated metal pipes that form a cross in the center of the structure.

**WASTE VOLUME:** 4,100,000,000 liters

**DURATION:** 1954 to 1957.

## ESTIMATED INVENTORY OF SELECTED HIGH-MOBILITY CONSTITUENTS

	WIDS	SIM
Uranium	270 Kg	1098 Kg
Tritium	0 Ci	3.3 Ci
Nitrate	100 Kg	232,600 Kg
Nitrite	--	203,400 Kg
Fluoride	--	5.15 Kg

## ESTIMATED INVENTORY OF SELECTED MEDIUM/LOW MOBILITY CONSTITUENTS

	WIDS	SIM
Co-60	0.002 Ci	0.002 Ci
Cs-137	28.8 Ci	56.2 Ci
Sr-90	59.4 Ci	31.4 Ci
Pu-239/240	42 Ci	0.018 Ci
Plutonium (total)	580 g	0.014 Ci
Total Beta Emitters	174 Ci	--

Note: "--" indicates inventory not estimated.

## REFERENCES:

WIDS general summary reports  
Hanford Soil Inventory Model, Rev 1 (RPP-26744)

## Basis of Knowledge

- Process History (PH)
- Interpretation of Downhole Geophysics (DG)
- Geologic Logs (GL)
- Extrapolation from Representative Site (RS)

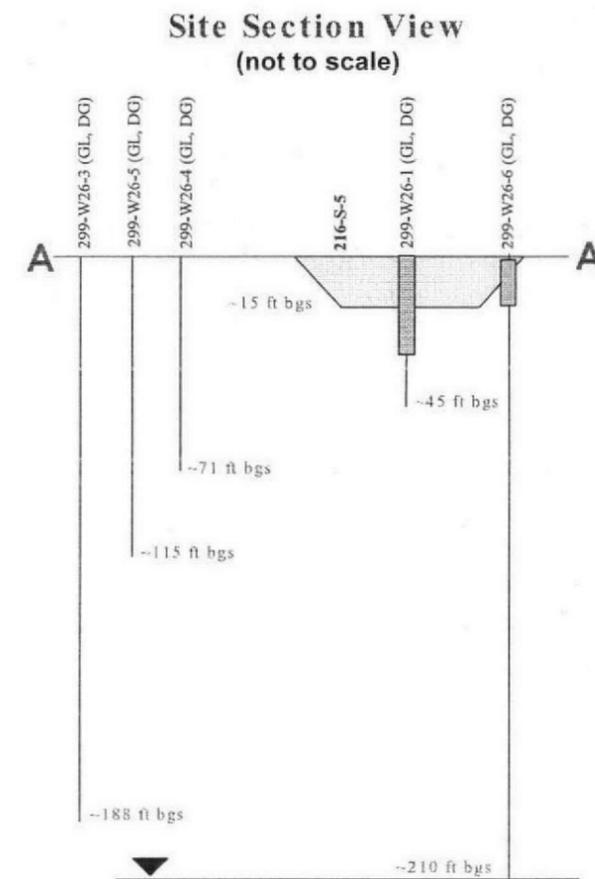

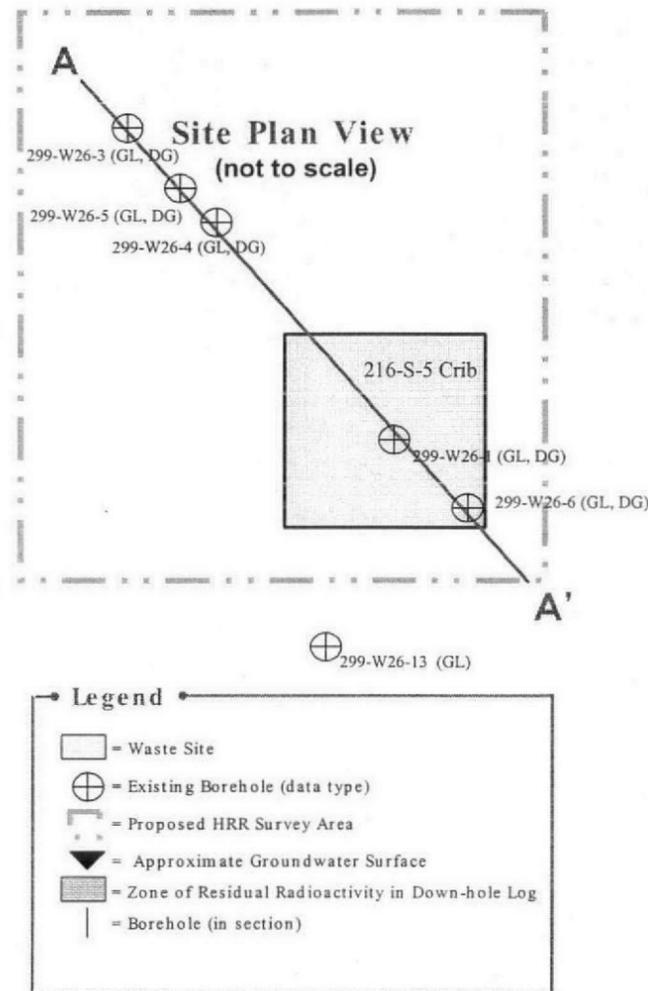

## Characterization Summary

- Scintillation probe and spectral gamma profiles from wells 299-W26-1, -3, -4, -5, and -6 indicate residual gamma emitters to about 30 feet bgs within the crib footprint.
- Process history including data from discharge stream.
- Assigned to representative site 216-U-10.

## Data Needs, Rationale, and Investigation Approach

No additional data are needed for 216-S-5. Decisions will be made using the following information:

- Existing site-specific information
- Information to be collected from 216-S-6 Crib
- High-resolution resistivity (HRR) survey of 216-S-5 and 216-S-6 combined area to identify potential conductivity plume that may be associated with contamination.

## Potential Viable Alternatives

- REMOVE/ TREAT/ DISPOSE
- PARTIAL REMOVAL/ TREATMENT/ BARRIER
- MESC/ MNA/ IC
- BARRIER

 Summary – Model Group 6 – 216-S-5 Crib  
 (200-CW-5/2/4/200-SC-1) (RL/FH) (CPP) (EPA). (2 Pages)

Background																																																																																																																																																																										
Site Identification	216-S-5																																																																																																																																																																									
Site Location	200 West Area; 200 West Ponds Zone, southwest of 207-S Retention Basin west of the 216-S-10 Ditch																																																																																																																																																																									
Type of Site	Crib																																																																																																																																																																									
Operating History	<p>The site consists of a gravel-filled crib containing two lengths of corrugated, perforated metal pipe that form a cross. The crib has been surface stabilized. It is marked and posted with Underground Radioactive Material signs. This unit received subsurface liquid disposal for the 202-S Building process vessel cooling water and steam condensate via an underground clay pipeline. The crib was built to replace the 216-S-17 Pond. The site is associated with the 202-S Building, the 207-S Retention Basin, and 216-S-6 Crib. The unit (originally called an underground swamp) was built as a temporary replacement for the grossly contaminated 216-S-17 Pond. In November 1954, the 216-S-6 Crib was built to receive condensate and cooling water with a high potential for contamination. Effluent with a low potential for contamination was sent to the 216-S-5 Crib. In 1957, the site was deactivated by valving out and locking the pipeline to the unit. The effluent was rerouted to the 216-S-16 Pond. The 207-S Retention Basin was bypassed in April 1954 due to being grossly contaminated. The basin later was backfilled with soil to prevent contamination migration.</p> <p>In 1956, the large cooling water discharge volumes made it necessary to cut a hole along the top edge of the crib to discharge overflow cooling water to a trench immediately southwest of the crib structure rather than allowing the crib to flood. The overflow of 50 to 100 gal/min represented approximately 5% of the total flow to the 216-S-5 Crib. The emergency overflow continued throughout the summer of 1956. In September 1956, the REDOX A-2 dissolver and H-4 coils failed. The dose rates along the edge of the crib overflow area increased from 100 millirad/h to 350 millirad/h with some spots reading up to 17 rad/h. The emergency crib overflow pond was used until the 216-S-16 Pond was completed in September 1957.</p> <p>In 1974, action was taken to fill in four cave-in depressions at the 216-S-5 Crib. This site is monitored by groundwater wells 299-W26-1, 299-W26-3, 299-W26-4, 299-W26-5, and 299-W26-6. Visual and radiological surveys are performed at the site. (WIDS)</p> <p>The crib is 64 by 64 m (210 by 210 ft) and 4.6 m (15 ft) deep. The crib operated from 1954 to 1957. Table AD-2. Data-Needs Priority  
 Summary – Model Group 6 – 216-S-5 Crib  
 (200-CW-5/2/4/200-SC-1) (RL/FH) (CPP) (EPA). (2 Pages)

Vicinity Waste Sites	216-S-6, 216-S-11, and 216-S-17						
Status	Analogous site; assigned to 216-U-10; evaluated in 200-CW-5/2/4/200-SC-1 feasibility study (DOE/RL-2004-24); capping identified as preferred alternative in feasibility study						
Potential Remedial Alternatives							
X for Viable Alternatives	No Action	MESC/MNA/IC	Removal/Disposal	Barrier	Partial Removal/Barrier	In Situ Treatment	Other
		X	X	X	X		
Data Evaluation and Gaps Analysis							
Data	Knowns	Data Uncertainties		Are supplemental data required to support decision making?			
Geophysical Logging 299-W26-06 (209.65 ft) (spectral gamma log 2003)	Located in the southeast corner of the crib. Cesium-137 detected from 3 to 16 ft in concentrations ranging from 0.4 to 2.5 pCi/g. The maximum concentration of Cs-137 was at 8 ft. Cesium-137 also was detected at 53 and 62 ft, with concentrations ~0.4 pCi/g.	Potential for impacts to groundwater		No. Existing information is sufficient for decision making for the shallow zone; HRR would provide information on elevated conductivity that may be associated with deeper contamination; the shallow borehole sampling at 216-S-6 would provide information to correlate the HRR and to evaluate protection of groundwater at 216-S-5 as well.			
299-W26-3 (188 ft) (scintillation log 1976)	Located 378 ft northwest of the center of the crib. Scintillation probe profiles show background level radiation.						
299-W26-4 (71 ft) (scintillation log 1976)	Located 287 ft northwest of the center of the crib. Scintillation probe profiles show background-level radiation.						
299-W26-1 (87 ft) (scintillation log 1976) (spectral gamma log 2006)	Located in the center of the crib area. Scintillation probe profiles indicate radioactive contaminants from 1.5 to 12.8 m (5 to 42 ft) bgs. The spectral gamma log identified Cs-137 in the same depth range as the scintillation log with a maximum concentration of 12,000 pCi/g at 5.8 m (19 ft) bgs.						
299-W26-5 (115 ft) (scintillation log 1976)	Located northwest of the center of the crib area between 299-W26-3 and 299-W26-4; scintillation probe profiles show background-level radiation.						
<b>Proposed Activities and Path Forward:</b>							
Conduct HRR surveys to evaluate potential for elevated conductivity plume that may be associated with contamination; use to help evaluate extent of contamination with depth.							
Use existing information and information from data collection activities at 216-S-6 to support remedial decision making for 216-S-5.

Figure AD-4. 216-S-6 Crib  
Conceptual Model and Data Summary.

200-SC-1 Operable Unit  
Waste Type: Steam Condensate

# 216-S-6 Crib

Model Group 6  
200-W Ponds Zone

## History

216-S-6 Crib is a liquid waste disposal site that received process cooling water and REDOX steam condensate from the 202-S Building. The waste stream was neutral to basic.

**CONSTRUCTION:** A square pit 210 ft by 210 ft by 15 ft deep, filled with gravel and a corrugated perforated metal pipe down the center with six pipes branching off perpendicular to the main pipe at 7 ft below the surface. The site is backfilled with 116,333 cu yd of gravel, 12,000 cu m contaminated soil and 13,000 cu m of "overburden" soils.

**WASTE VOLUME:** 4,470,000,000 liters

**DURATION:** 1954 to 1972

## ESTIMATED INVENTORY OF SELECTED HIGH-MOBILITY CONSTITUENTS

	WIDS	SIM
Uranium	272 Kg	853 Kg
Tritium	0.00 Ci	3.549 Ci
Nitrate	140 Kg	253,500 Kg
Nitrite	--	221,100 Kg
Fluoride	--	3.9 Kg

## ESTIMATED INVENTORY OF SELECTED MEDIUM/ LOW MOBILITY CONSTITUENTS

	WIDS	SIM
Co-60	0.258 Ci	0.0008 Ci
Cs-137	125.0 Ci	11.3 Ci
Sr-90	224.0 Ci	5.8 Ci
Pu-239/240	34.3 Ci	0.3 Ci
Plutonium	473 g	--
Total Beta Emitters	901 Ci	--

Note: "--" indicates inventory not estimated

Hanford Soil Inventory Model, Rev 1 (RPP-26744)

## Basis of Knowledge

- Process History (PH)
- Interpretation of Downhole Geophysics (DG)
- Interpretation of Surface Geophysics (SG)
- Geologic Logs (GL)
- Extrapolation from Representative Site (RS)

## Characterization Summary

- One scintillation probe profile from well 299-W26-2 to approximately 90 ft bgs indicates no detectable gamma emitters.
- Process history including data from discharge stream.
- Surface scans identified contaminated plants growing on the site.
- Assigned to representative site 216-U-10.

## Potential Viable Alternatives

- REMOVE/ TREAT/ DISPOSE
- PARTIAL REMOVAL/ TREATMENT/ BARRIER
- MESC/ MNA/ IC
- BARRIER

## Data Needs, Rationale, and Investigation Approach

Additional information is required for the following reasons:

- The analogous relationship to 216-U-10 is uncertain.
- The potential exists for deeper contamination associated with mobile contaminants that may impact groundwater (e.g., nitrate, uranium).

The supplemental investigation strategy incorporates the following elements:

- High-resolution resistivity (HRR) survey to identify the presence of subsurface conductivity plumes that may indicate subsurface contaminants.
- Install one shallow borehole to a depth of about 100 feet bgs. Collect subsurface soil samples and analyze them as specified.
- Correlate the soil sample analyses to results of HRR survey to obtain site-specific data to reduce the uncertainty between 216-S-6 and the representative site.
- Data collected at 216-S-6 will also be used to support decision making for 216-S-5.

Background																																																																																																																																																																										
Site Identification	216-S-6																																																																																																																																																																									
Site Location	200 West Area, 200-W Ponds, northwest of the 216-S-5 Crib and north of 216-S-17 Pond.																																																																																																																																																																									
Type of Site	Crib																																																																																																																																																																									
Operating History	<p>This unit consists of a square pit filled with gravel with corrugated, perforated metal pipe running down the center, and six pipes branching off perpendicular to the main pipe. The site is backfilled and marked with Underground Radioactive Material signs. This unit received subsurface process cooling water and steam condensate from the 202-S Building waste via an underground pipeline. The site is associated with the 202-S Building, the 207-S Retention Basin, the 2904-S-171 Control Structure, and the 215-S-5 Crib. This site operated from November 1954 to July 1972. The crib was constructed as part of the Segregation Project. REDOX effluent with a high potential for contamination was diverted to the 216-S-6 Crib. Effluent with a low potential for contamination was sent to the 216-S-5 Crib.</p> <p>After July 1967, the site received the steam condensate from the D-12 and D-14 Waste Concentrators in the 202-S Building. The waste is low salt, neutral to basic and contains nitrates.</p> <p>In September 1955, both the 216-S-5 and 216-S-6 Cribs were operated at greater-than-capacity levels. Temporary relief was provided by blading off the corner of the 216-S-6 Crib and cutting a run off ditch. The overflow was considered a better option than allowing the crib to flood and damage the roof seal. No contamination problems were noted in the overflow area in 1955. (WIDS)</p> <p>The crib is 64 by 64 m (210 by 210 ft) and 4.6 m (15 ft) deep. The crib operated from 1954 to 1972. Data Evaluation and Gaps Analysis							
Data	Knowns	Data Uncertainties		Are supplemental data required to support decision making?			
Geophysical logging 299-W26-2 (230 ft) (scintillation log 1976)	Located east of and outside of the crib. Scintillation probe profiles indicate background radiation levels.	Potential for impacts to groundwater from mobile contaminants such as nitrate and uranium		Yes. The analogous relationship between 216-U-10 (representative site) and 216-S-6 is somewhat uncertain. While inventory, geophysical logs, and analogous relationships may support shallow vadose zone decision making, HRR surveys would provide indication of deeper zones of elevated conductivity that may be associated with contamination. A shallow borehole would help correlate with the HRR by providing samples that can be evaluated for pore water contamination (similar to the 216-B-26 borehole drilled in the BC Cribs and Trenches area). These analyses would support the protection of groundwater evaluation for both the 216-S-6 and 216-S-5 Cribs. Supplemental data would provide site-specific information on remaining inventory of mobile contaminants, such as uranium and nitrate, in the soil column that may impact groundwater.			
299-W26-51 (106 ft) (spectral gamma log 2006) (moisture log 2006)	Located in center of crib. Cs-137 was detected from 2.1 to 18.9 m (7 to 62 ft) bgs with a maximum concentration of 3,800 pCi/g at 13.7 m (45 ft) bgs. The moisture detected in the well was variable due to the presence of a grout seal from the surface to 6 m (20 ft) bgs. Below this depth, moisture appears to increase at about 11.9, 14, 18, 20.7, 23.8 m (39, 46, 59, 68, 78 ft), and from 28 m (92 ft) to the bottom of the borehole at 32.3 m (106 ft).						
<b>Proposed Activities and Path Forward:</b>							
Conduct HRR surveys to evaluate the presence of subsurface conductivity that may be associated with mobile contaminants that could impact groundwater.							
Install shallow borehole to correlate results of HRR and to obtain site-specific data needed because of differences between the representative site and 216-S-6.							
Data collected at 216-S-6 also would be used to support 216-S-5 decision making because these two sites received similar waste streams, with the higher concentration effluent going to 216-S-6. 216-S-6 is bounding for 216-S-5 decision making.							

Additional Notes: Soil Inventory Model inventory identifies >800 kg uranium and >200,000 kg each of nitrate and nitrite.

200-SC-1 Operable Unit  
Waste Type: Steam Condensate

# 216-T-36 Crib

Model Group 6  
T Farm Zone

## History

216-T-36 Crib is a liquid waste disposal site that received process steam condensate, equipment decontamination waste and miscellaneous radioactive waste from 221-T and 221-U buildings and decontamination waste from 2706-T building. The waste stream was an alkaline aqueous waste.

**CONSTRUCTION:** The 216-T-36 crib consists of a clay distribution pipe placed in a rectangular trench with bottom dimensions of 160 ft by 10 ft by 15 ft deep, filled with gravel and soil.

**WASTE VOLUME:** 522,000 liters

**DURATION:** 1967 to 1969 (end of use not clearly identified).

## ESTIMATED INVENTORY OF SELECTED HIGH-MOBILITY CONSTITUENTS

	WIDS	SIM
Uranium	1.18 Kg	172 Kg
Tritium	0.00 Ci	0.001 Ci
Nitrate	0.00 Kg	4,950 Kg
Nitrite	0.00 Kg	563 Kg
Fluoride	0.0 Kg	0.0 Kg
Chromium	--	212 Kg

## ESTIMATED INVENTORY OF SELECTED MEDIUM/ LOW MOBILITY CONSTITUENTS

	WIDS	SIM
Co-60	--	0.00008 Ci
Cs-137	0.06 Ci	0.07 Ci
Sr-90	0.05 Ci	0.6 Ci
Pu-239/240	0.0 Ci	22.8 Ci
Pu-241	0.0 Ci	111 Ci
Plutonium	0.24 Ci	--
Total Beta Emitters	0.72 Ci	--
Total Alpha Emitters	22.7 Ci	--

Note: "--" indicates inventory not estimated.

## REFERENCES:

WIDS general summary reports  
Hanford Soil Inventory Model, Rev 1 (RPP-26744)

## Basis of Knowledge

- Process History (PH)
- Interpretation of Downhole Geophysics (DG)
- Extrapolation from Representative Site (RS)

## Characterization Summary

- No site-specific measurements. Process history only.
- Assigned as analogous to representative site 216-T-26.
- Downhole geophysics from two nearby wells (299-W10-2 and 299-W10-4) indicate subsurface contamination by gamma emitting nuclides pre-dating 216-T-36. Tc-99 groundwater plume in this area.
- HRR survey indicates areas of elevated conductivity near the east side of the crib and limited conductivity directly below the crib.

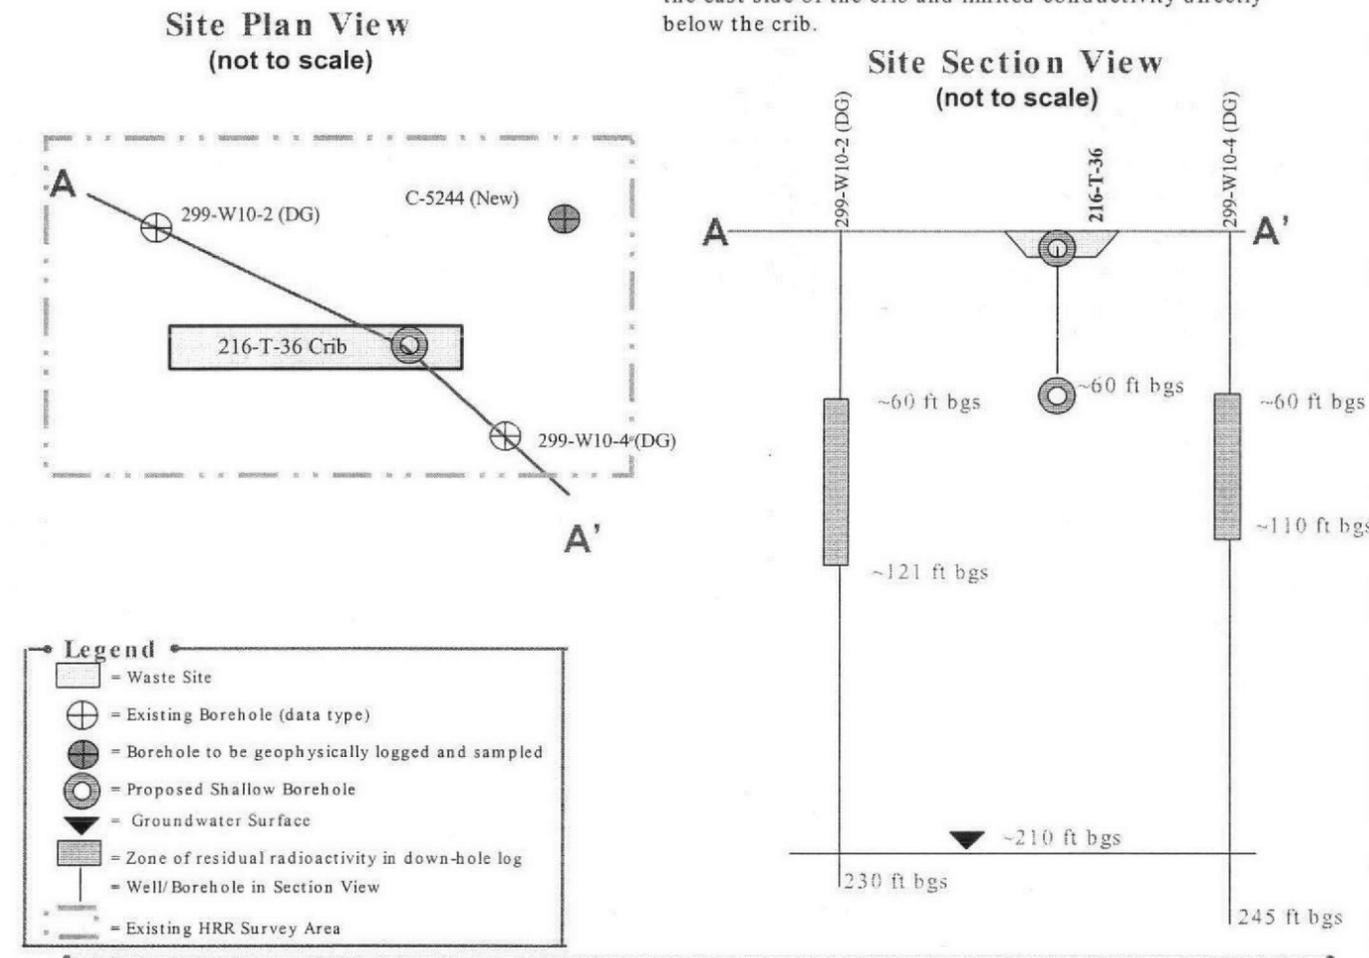

## Data Needs, Rationale, and Investigation Approach

### Additional Information may be required for the following reasons:

- Based on current groundwater conditions (e.g., Tc-99) in the vicinity of this site, the inventory for 216-T-36 may be uncertain.

### The supplemental investigation incorporates the following elements:

- A new deep borehole (to be installed by the groundwater program) will be installed and sampled.
- Sampling and analysis results and downhole geophysics from the new borehole will be evaluated.
- If the new borehole indicates soil contamination that suggests contribution from 216-T-36, then a shallow borehole (to about 60 feet bgs) will be placed within the crib footprint and subsurface soil samples will be collected and analyzed as specified.
- The sampling and analysis results from the new borehole(s) will be correlated to existing HRR survey data.

## Potential Viable Alternatives

Table AD-5. Data-Needs Priority  
 Summary – Model Group 6 – 216-T-36 Crib  
 (200-SC-1) (RL/FH) (CPP) (EPA). (2 Pages)

Background																																																																																																																																																																										
Site Identification	216-T-36 Crib																																																																																																																																																																									
Site Location	200 West Area, T Farm Zone, south of 241-T Tank Farm; north of 241-TY Tank Farm																																																																																																																																																																									
Type of Site	Crib																																																																																																																																																																									
Operating History	<p>The site consists of an interim stabilized crib posted as Underground Radioactive Material. The site consists of a single vitreous clay distribution pipe resting in a gravel layer that is in a rectangular trench. Backfill covers the pipe and gravel. The crib also has a gage well riser and a filter riser. This site provided subsurface liquid disposal for steam condensate, equipment decontamination waste, and miscellaneous waste from the 221-T and 221-U Buildings. The site also received decontamination waste from the 2706-T Building. Associated structures are the 221-T, 221-U, and 2706-T Buildings and the 200-W-79 Pipeline. The site started operation in May 1967. The end date is unclear. However, a shutdown date between 1970 and 1973 is likely based on available documentation. One WIDS source indicates the 216-T-36 Crib was built to replace the 216-T-28 Crib. Data Evaluation and Gaps Analysis							
Data	Knowns	Data Uncertainties		Are supplemental data required to support decision making?			
Scintillation Logs (ARH-ST-156):		Based on current groundwater conditions, the inventory for this site may be uncertain.		Potentially. A deep borehole is planned for fiscal year 2007 to evaluate the Tc-99 plume in the groundwater in this area. The borehole will be located to the northeast of the 216-T-36 Crib. Based on the information from the groundwater borehole, a shallow borehole may be needed in the 216-T-36 Crib to resolve uncertainties in the inventory and resulting contaminant concentrations. If the groundwater borehole indicates substantial vadose zone contamination, then a shallow borehole will be drilled in the 216-B-36 Crib to obtain site-specific information to correlate with HRR and to support site-specific risk assessment and the decision making for the 216-T-36 Crib.			
299-W10-2 (230 ft) (1976)	Located 10 m (33 ft) north of the northwest corner of the 216-T-36 Crib. Scintillation log from 1976 indicates minor ( $10^4$ cpm) at ~30 m (100 ft) bgs. ARH-ST-156 implies this contamination is associated with 216-T-7 rather than 216-T-36.						
299-W10-4 (245 ft) (1976)	Located 10 m (33 ft) south of the southeast corner of the 216-T-36 Crib. Scintillation logs from 1959, 1963, and 1976 indicate minor ( $10^3$ to $10^4$ cpm) at ~30 m (100 ft) bgs. ARH-ST-156 implies this contamination is associated with 216-T-7 rather than 216-T-36.						
HRR surveys (2006)	The 216-T-36 Crib is located in an area of increasing Tc-99 concentrations in the groundwater.  HRR surveys show some areas of higher conductivity near the east side of this crib. The area directly below the crib shows limited conductivity to a depth of >40 m (130 ft) bgs (RPP-RPT-28955)						
<b>Proposed Activities and Path Forward:</b>							
Evaluate data from the groundwater borehole to be drilled to the northeast of the 216-T-36 Crib in fiscal year 2007.							
Install a contingent shallow borehole if the vadose information from the groundwater well indicates substantial contamination.

Table AD-6. 216-B-55 Crib Sampling Plan.

Sample Collection Methodology	Sample Location	Maximum Depth of Investigation	Sample Interval Depth (ft bgs) <sup>a</sup>	Analyte List <sup>b</sup>	Physical Properties	
					Sample Interval	Parameters
Direct push with sampling	Five direct-push holes <sup>e</sup>	50 ft bgs	12.5 – 15 ft bgs	Analytes are presented in Volume I, Table A2-3, the 200-CW-5, 200-CW-2, 200-CW-4, and 200-SC-1 columns.	N/A	N/A
	One direct-push hole <sup>f</sup>	50 ft bgs	Sample at depths of: 3.5 – 6 ft bgs 12.5 – 15 ft bgs 17.5 – 20 ft bgs 27.5 – 30 ft bgs 47.5 – 50 ft bgs	Analytes are presented in Volume I, Table A2-3, the 200-CW-5, 200-CW-2, 200-CW-4, and 200-SC-1 columns.	N/A	N/A
Number of split-spoon samples		10				
Approximate number of field quality-control samples <sup>c</sup>		3				
Approximate total number of soil samples collected		13				
Approximate total number of soil samples initially analyzed <sup>d</sup>		8				
Non-Sample Data Collection	Maximum Depth of Investigation					
Downhole gamma-spectroscopy log, neutron moisture, passive neutrons	Surface to TD in five direct-push holes to 50 ft bgs and one existing well E28-13 to 230 ft bgs					

<sup>a</sup> Actual sampling depths may vary depending on the amount of backfill/overburden used in interim stabilization activities at the waste site, field screening results, and varying subsurface conditions.

<sup>b</sup> See Volume I, Appendix A, Tables A2-1, A2-2, A2-3, A2-5, and A3-2 for detection limits and other analytical parameters.

<sup>c</sup> One duplicate, one split, and one equipment blank. Field blanks also will be collected for volatile organic analysis, but are not included here.

<sup>d</sup> Number of samples analyzed includes five split-spoon samples and three field quality-control samples. Five additional split spoons associated with five direct pushes will be analyzed in accordance with footnote e.

<sup>e</sup> Analyze these samples only if geophysical logging shows no contamination.

<sup>f</sup> Install sixth direct push at location of highest contamination from the initial five pushes, to collect and analyze soil samples. If the logging results of the first five pushes do not indicate contamination, install sixth direct push at the head end of the ditch and sample throughout the push to obtain vertical distribution of contaminants.

bgs = below ground surface. N/A = not applicable. TD = total depth.

Conceptual Model and Data Summary.

200-SC-1 Operable Unit  
Waste Type: Steam Condensate

# 216-B-55 Crib

Model Group 6  
B Plant Zone

## History

216-B-55 Crib is a liquid waste disposal site that received contaminated steam condensate from the 221-B Building.

**CONSTRUCTION:** A covered, gravel-filled trench with bottom dimensions of 750 feet long by 10 feet wide and about 13 feet deep. A perforated 30-inch diameter galvanized pipe runs the length of the unit.

**WASTE VOLUME:** 1,230,000,000 liters

**DURATION:** 1967 to 1991.

## ESTIMATED INVENTORY OF SELECTED HIGH-MOBILITY CONSTITUENTS

	WIDS	SIM
Uranium	<0.54 Kg	0.0003 Kg
Tritium	3.74 Ci	0.0002 Ci
Nitrate	--	604 Kg
Fluoride	--	159 Kg

## ESTIMATED INVENTORY OF SELECTED MEDIUM/ LOW MOBILITY CONSTITUENTS

	WIDS	SIM
Co-60	0.38 Ci	0.0004 Ci
Cs-137	21.1 Ci	0.14 Ci
Sr-90	<11.1 Ci	0.0002 Ci
Plutonium	<0.46 g	0.00014 Ci
Total Beta Emitters	150 Ci	--

Note: "--" indicates inventory not estimated

## REFERENCES:

WIDS general summary reports  
Hanford Soil Inventory Model, Rev 1 (RPP-26744)

## Basis of Knowledge

- Process History (PH)
- Geologic Logs (GL)
- Extrapolation from Representative Site (RS)

## Characterization Summary

- One geologic log from well 299-E28-16
- Process history including data from discharge stream
- Assigned to representative site 216-U-10.

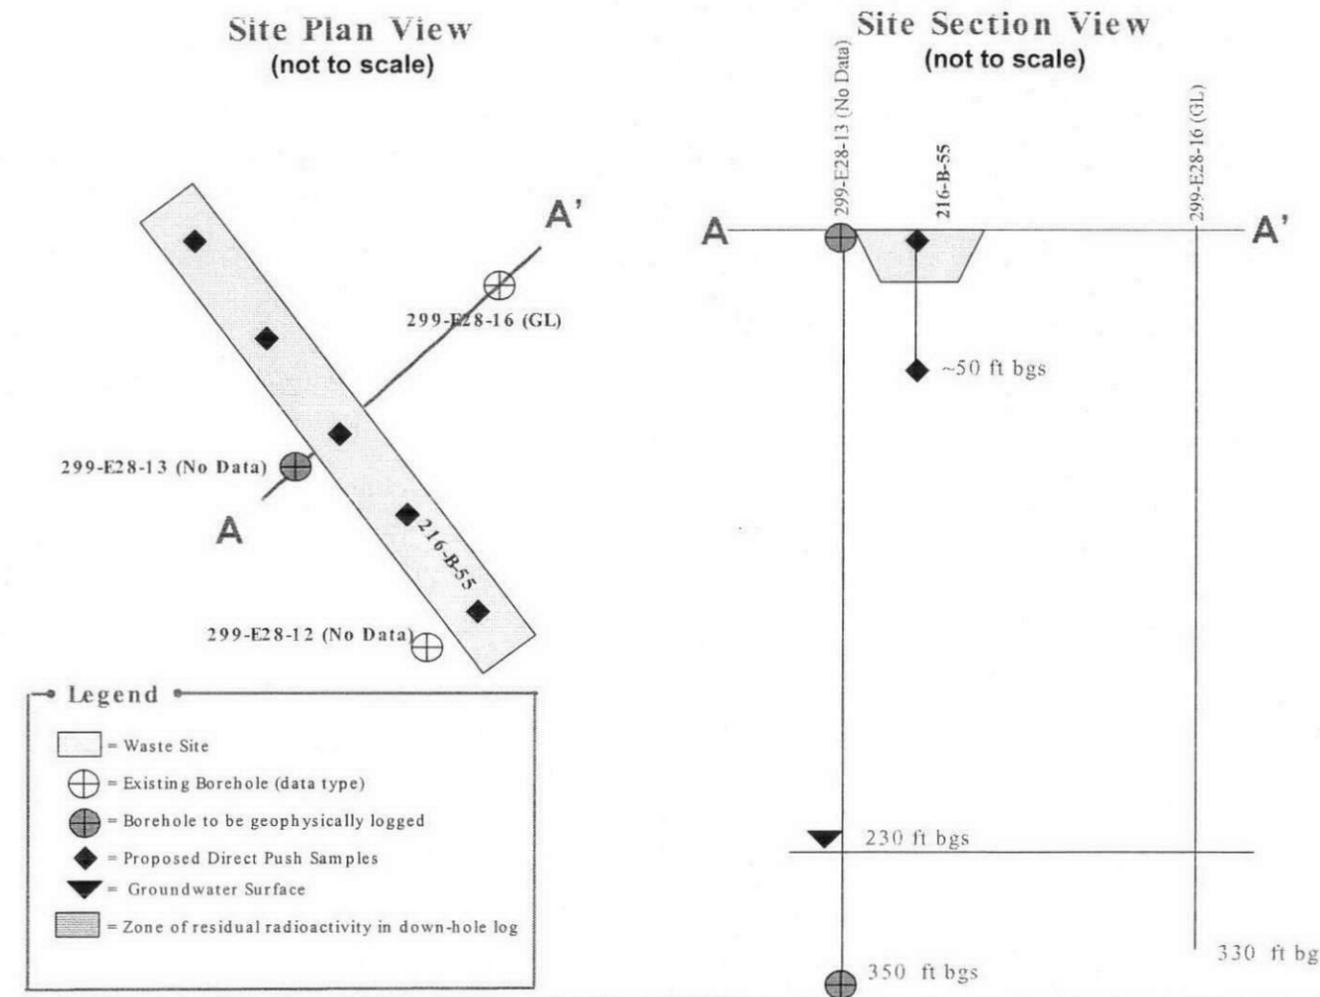

## Data Needs, Rationale, and Investigation Approach

No additional data are required to support a decision based on the analogous relationship; however additional information is useful for the following reasons:

- The analogous relationship with 216-U-10 is expected to be bounding; however, the actual inventory at this facility may be substantially lower, providing the opportunity to support a no action alternative, or other non-intrusive alternatives.
- Supplemental information may also support reducing the scope of intrusive remediation (e.g., partial removal/treatment/barrier).

The supplemental investigation strategy incorporates the following elements:

- Geophysically log existing well 299-E28-13, using gamma spectroscopy, neutron moisture, and passive neutron logging techniques.
- Install 5 direct push holes along the axis of the crib and geophysically-log the holes and collect soil samples at the elevation of the crib bottom. Identify locations of elevated gamma activity.
- Collect subsurface soil samples from one direct push hole located at the point of highest gamma activity identified in the five logged holes. If no gamma response is found in the first five holes, then locate the sixth hole near the head end of the trench, collect soil samples and analyze as specified.

## Potential Viable Alternatives

- NO ACTION
- REMOVE/ TREAT/ DISPOSE
- PARTIAL REMOVAL/ TREATMENT/ BARRIER
- MESC/ MNA/ IC
- BARRIER

 Summary – Model Group 6 – 216-B-55 Crib  
 (200-CW-5/2/4/200-SC-1) (RL/FH) (CPP) (EPA). (2 Pages)

Background																																																																																																																																																																										
Site Identification	216-B-55 Crib																																																																																																																																																																									
Site Location	200 East Area; B Plant Zone; west of 225-B and north of 7 <sup>th</sup> Street																																																																																																																																																																									
Type of Site	Crib																																																																																																																																																																									
Operating History	<p>The site is marked with concrete AC-540 markers and posted with Underground Radioactive Material signs.</p> <p>The unit is filled with approximately 1380 m<sup>3</sup> (1,800 yd<sup>3</sup>) of gravel. A perforated 30 cm (30-in.) diameter galvanized pipe runs the length of the unit, 0.9 m (3 ft) above the bottom. The site had two gage wells of 20 cm (8-in.) steel pipe with a galvanized sheet metal cap. Each well extended from the crib bottom to approximately 0.9 m (3 ft) above grade. The crib was constructed with 19,500 ft<sup>2</sup> of membrane barrier. The site received 1.23 billion liters of steam condensate from 221-B. The crib is adjacent to an area of reoccurring, spreading contamination known as UPR-200-E-64. (WIDS)</p> <p>The crib is 228 m long by 3.1 m wide (750 ft by 10 ft) (WIDS). The depth is uncertain, but appears to be approximately 13 ft deep (H-2-60330). The crib operated from 1967 to 1991 (WIDS).</p> <p>Soil Inventory Model – 216-B-55 (RPP-26744)</p> <table border="1"> <thead> <tr> <th>Na (kg)</th> <th>Al (kg)</th> <th>Fe (kg)</th> <th>Cr (kg)</th> <th>Bi (kg)</th> <th>La (kg)</th> <th>Hg (kg)</th> <th>Zr (kg)</th> <th>Pb (kg)</th> </tr> </thead> <tbody> <tr> <td>2.490E+03</td> <td>9.318E-02</td> <td>4.231E+01</td> <td>1.474E-02</td> <td>9.513E-06</td> <td>0.000E+00</td> <td>2.936E-06</td> <td>1.259E-06</td> <td>6.649E+00</td> </tr> <tr> <th>Ni (kg)</th> <th>Ag (kg)</th> <th>Mn (kg)</th> <th>Ca (kg)</th> <th>K (kg)</th> <th>NO3 (kg)</th> <th>NO2 (kg)</th> <th>CO3 (kg)</th> <th>PO4 (kg)</th> </tr> <tr> <td>9.903E-04</td> <td>0.000E+00</td> <td>6.044E+00</td> <td>2.273E+04</td> <td>8.958E+02</td> <td>6.045E+02</td> <td>3.579E-01</td> <td>9.067E+04</td> <td>5.572E-03</td> </tr> <tr> <th>SO4 (kg)</th> <th>Si (kg)</th> <th>F (kg)</th> <th>Cl (kg)</th> <th>CCl4 (kg)</th> <th>Butanol (kg)</th> <th>TBP (kg)</th> <th>NPH (kg)</th> <th>NH3 (kg)</th> </tr> <tr> <td>1.245E+04</td> <td>2.974E+03</td> <td>1.596E+02</td> <td>1.058E+03</td> <td>0.000E+00</td> <td>1.754E-08</td> <td>0.000E+00</td> <td>0.000E+00</td> <td>3.772E-03</td> </tr> <tr> <th>Fe(CN)6 (kg)</th> <th>H-3 (Ci)</th> <th>C-14 (Ci)</th> <th>Ni-59 (Ci)</th> <th>Ni-63 (Ci)</th> <th>Co-60 (Ci)</th> <th>Se-79 (Ci)</th> <th>Sr-90 (Ci)</th> <th>Y-90 (Ci)</th> </tr> <tr> <td>0.000E+00</td> <td>1.770E-04</td> <td>3.399E-05</td> <td>6.417E-06</td> <td>6.098E-04</td> <td>3.926E-04</td> <td>4.049E-06</td> <td>2.197E-04</td> <td>2.197E-04</td> </tr> <tr> <th>Zr-93 (Ci)</th> <th>Nb-93m (Ci)</th> <th>Tc-99 (Ci)</th> <th>Ru-106 (Ci)</th> <th>Cd-113m (Ci)</th> <th>Sb-125 (Ci)</th> <th>Sn-126 (Ci)</th> <th>I-129 (Ci)</th> <th>Cs-134 (Ci)</th> </tr> <tr> <td>2.412E-04</td> <td>1.947E-04</td> <td>1.291E-03</td> <td>3.687E-10</td> <td>2.523E-04</td> <td>5.996E-05</td> <td>1.683E-05</td> <td>7.634E-07</td> <td>1.353E-07</td> </tr> <tr> <th>Cs-137 (Ci)</th> <th>Ba-137m (Ci)</th> <th>Sm-151 (Ci)</th> <th>Eu-152 (Ci)</th> <th>Eu-154 (Ci)</th> <th>Eu-155 (Ci)</th> <th>Ra-226 (Ci)</th> <th>Ra-228 (Ci)</th> <th>Ac-227 (Ci)</th> </tr> <tr> <td>1.433E-01</td> <td>1.354E-01</td> <td>5.316E-02</td> <td>9.925E-06</td> <td>7.391E-04</td> <td>3.411E-04</td> <td>1.890E-10</td> <td>8.757E-09</td> <td>1.119E-09</td> </tr> <tr> <th>Pa-231 (Ci)</th> <th>Th-229 (Ci)</th> <th>Th-232 (Ci)</th> <th>U-232 (Ci)</th> <th>U-233 (Ci)</th> <th>U-234 (Ci)</th> <th>U-235 (Ci)</th> <th>U-236 (Ci)</th> <th>U-238 (Ci)</th> </tr> <tr> <td>3.058E-09</td> <td>4.858E-11</td> <td>1.353E-10</td> <td>2.324E-09</td> <td>1.434E-07</td> <td>9.993E-08</td> <td>4.173E-09</td> <td>2.723E-09</td> <td>9.357E-08</td> </tr> <tr> <th>U-Total (kg)</th> <th>Np-237 (Ci)</th> <th>Pu-238 (Ci)</th> <th>Pu-239 (Ci)</th> <th>Pu-240 (Ci)</th> <th>Pu-241 (Ci)</th> <th>Pu-242 (Ci)</th> <th>Am-241 (Ci)</th> <th>Am-243 (Ci)</th> </tr> <tr> <td>2.805E-04</td> <td>4.206E-06</td> <td>1.969E-06</td> <td>4.575E-05</td> <td>1.061E-05</td> <td>8.933E-05</td> <td>7.363E-10</td> <td>6.433E-05</td> <td>3.694E-08</td> </tr> <tr> <th>Cm-242 (Ci)</th> <th>Cm-243 (Ci)</th> <th>Cm-244 (Ci)</th> <td></td> <td></td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>2.269E-07</td> <td>6.970E-09</td> <td>1.739E-07</td> <td></td> <td></td> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>								Na (kg)	Al (kg)	Fe (kg)	Cr (kg)	Bi (kg)	La (kg)	Hg (kg)	Zr (kg)	Pb (kg)	2.490E+03	9.318E-02	4.231E+01	1.474E-02	9.513E-06	0.000E+00	2.936E-06	1.259E-06	6.649E+00	Ni (kg)	Ag (kg)	Mn (kg)	Ca (kg)	K (kg)	NO3 (kg)	NO2 (kg)	CO3 (kg)	PO4 (kg)	9.903E-04	0.000E+00	6.044E+00	2.273E+04	8.958E+02	6.045E+02	3.579E-01	9.067E+04	5.572E-03	SO4 (kg)	Si (kg)	F (kg)	Cl (kg)	CCl4 (kg)	Butanol (kg)	TBP (kg)	NPH (kg)	NH3 (kg)	1.245E+04	2.974E+03	1.596E+02	1.058E+03	0.000E+00	1.754E-08	0.000E+00	0.000E+00	3.772E-03	Fe(CN)6 (kg)	H-3 (Ci)	C-14 (Ci)	Ni-59 (Ci)	Ni-63 (Ci)	Co-60 (Ci)	Se-79 (Ci)	Sr-90 (Ci)	Y-90 (Ci)	0.000E+00	1.770E-04	3.399E-05	6.417E-06	6.098E-04	3.926E-04	4.049E-06	2.197E-04	2.197E-04	Zr-93 (Ci)	Nb-93m (Ci)	Tc-99 (Ci)	Ru-106 (Ci)	Cd-113m (Ci)	Sb-125 (Ci)	Sn-126 (Ci)	I-129 (Ci)	Cs-134 (Ci)	2.412E-04	1.947E-04	1.291E-03	3.687E-10	2.523E-04	5.996E-05	1.683E-05	7.634E-07	1.353E-07	Cs-137 (Ci)	Ba-137m (Ci)	Sm-151 (Ci)	Eu-152 (Ci)	Eu-154 (Ci)	Eu-155 (Ci)	Ra-226 (Ci)	Ra-228 (Ci)	Ac-227 (Ci)	1.433E-01	1.354E-01	5.316E-02	9.925E-06	7.391E-04	3.411E-04	1.890E-10	8.757E-09	1.119E-09	Pa-231 (Ci)	Th-229 (Ci)	Th-232 (Ci)	U-232 (Ci)	U-233 (Ci)	U-234 (Ci)	U-235 (Ci)	U-236 (Ci)	U-238 (Ci)	3.058E-09	4.858E-11	1.353E-10	2.324E-09	1.434E-07	9.993E-08	4.173E-09	2.723E-09	9.357E-08	U-Total (kg)	Np-237 (Ci)	Pu-238 (Ci)	Pu-239 (Ci)	Pu-240 (Ci)	Pu-241 (Ci)	Pu-242 (Ci)	Am-241 (Ci)	Am-243 (Ci)	2.805E-04	4.206E-06	1.969E-06	4.575E-05	1.061E-05	8.933E-05	7.363E-10	6.433E-05	3.694E-08	Cm-242 (Ci)	Cm-243 (Ci)	Cm-244 (Ci)							2.269E-07	6.970E-09	1.739E-07

Table AD-7. Data-Needs Priority  
 Summary – Model Group 6 – 216-B-55 Crib  
 (200-CW-5/2/4/200-SC-1) (RL/FH) (CPP) (EPA). (2 Pages)

Vicinity Waste Sites	216-B-12, UPR-200-E-64						
Status	Analogous site; assigned to 216-U-10 in 200-CW-5/2/4/200-SC-1 feasibility study (DOE/RL-2004-24); capping identified as preferred alternative in feasibility study.						
Potential Remedial Alternatives							
X for Viable Alternatives	No Action	MESC/MNA/IC	Removal/Disposal	Barrier	Partial Removal/Barrier	In Situ Treatment	Other
	X	X	X	X	X		
Data Evaluation and Gaps Analysis							
Data	Knowns	Data Uncertainties		Are supplemental data required to support decision making?			
Well 299-E28-12 (349 ft) (scintillation logs 1968, 1970, and 1976)	Located 4 m (13 ft) from the crib edge on the southeast end. Only background radioactivity was detected	Nature and extent of contamination is uncertain; however, contaminant concentrations are expected to be low based on Soil Inventory Model inventory estimate. Analogous relationship with representative site is a bounding relationship. Site-specific data may indicate no action or MESC/MNA/IC are more appropriate.		No. Analogous relationship and inventory data could be used to support decision making. However, this crib is assigned to 216-U-10, which has a larger inventory of several constituents. While the analogous relationship with 216-U-10 would bound the decision process, supplemental data at 216-B-55 may permit a stronger analysis of the no action and MESC/MNA/IC alternatives and may permit a lesser alternative than the analogous evaluation. Supplemental data would provide site-specific confirmatory information on the nature and extent of contamination; because the crib is large, the supplemental data would allow assessment of partial removal alternative and permit a more accurate evaluation of contaminant volume and cost.			
<b>Proposed Activities and Path Forward:</b>							
Geophysically log well 299-E28-13.							
Install five direct pushes along length of crib; geophysically log the holes; collect soil samples at bottom of crib.							
Install sixth direct push at location of highest contamination from the initial five pushes to collect and analyze soil samples. If the logging results of the first five pushes do not indicate contamination, install sixth direct push at the head end of the ditch and sample throughout the push to obtain vertical distribution of contaminants.

# 216-A-37-2 Crib

Model Group 6  
PUREX Zone

## History

216-A-37-2 Crib is a liquid waste disposal site constructed as a replacement for 216-A-30 Crib and received contaminated steam condensate, equipment disposal tunnel floor and water-filled door drainage, and fuel slug storage basin overflow from the 202-A Building (PUREX).

**CONSTRUCTION:** A covered, gravel-filled trench with bottom dimensions of 1,400 feet long by 10 feet wide and about 16 feet deep. Two perforated galvanized pipes run the length of the unit.

**WASTE VOLUME:** 1,290,000,000 liters

**DURATION:** 1983 to 1995.

### ESTIMATED INVENTORY OF SELECTED HIGH-MOBILITY CONSTITUENTS

	WIDS	SIM
Uranium	0.005 Ci	47.6 Kg
U-234	--	0.02 Ci
Tritium	5.08 Ci	9.5 Ci
Nitrate	--	617 Kg
Fluoride	--	149 Kg

### INVENTORY OF MEDIUM/ LOW MOBILITY CONSTITUENTS

	WIDS	SIM
Cs-137	0.102 Ci	--
Sr-90	0.132 Ci	0.06 Ci
Plutonium	--	1.34 Ci
Total Beta Emitters	0.672 Ci	--

Note: "--" indicates inventory not estimated.

### REFERENCES:

WIDS general summary reports  
Hanford Soil Inventory Model, Rev 1 (RPP-26744)

## Basis of Knowledge

- Process History (PH)
- Interpretation of Downhole Geophysics (DG)
- Geologic Logs (GL)
- Extrapolation from Representative Site (RS)

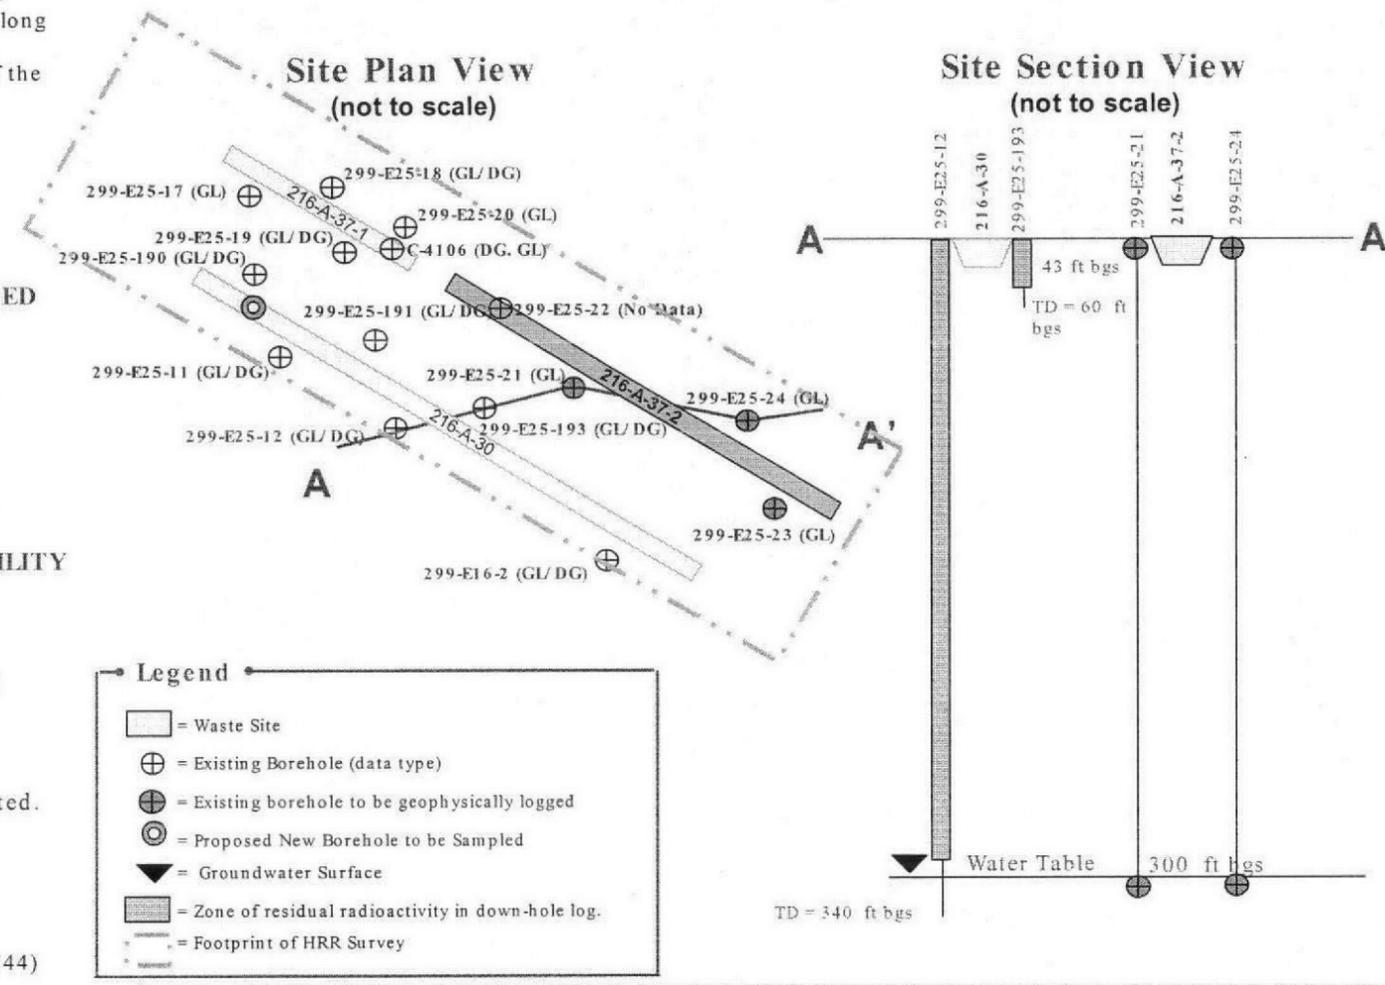

## Characterization Summary

- Operating history and scintillation log of well 299-E25-12 (adjacent to 216-A-30) suggests potential for deep contamination at relatively low concentrations under 216-A-30.
- Assigned to representative site 216-U-10.

## Data Needs, Rationale, and Investigation Approach

**No additional data are needed for 216-A-37-2. Decisions at this site will be made using the following information:**

- The estimated inventory for the site is relatively low.
- The site received the same waste stream as 216-A-30 Crib and the information derived from that site can be used to describe conditions at 216-A-37-2. 216-A-30 should provide bounding conditions for 216-A-37-2.
- 216-A-37-2 will be included in the conductivity survey to be conducted at 216-A-30.
- Conduct downhole geophysical logging (gamma spectroscopy, neutron moisture, and passive neutron) at three nearby existing wells to supplement information.
- Results of sampling and analysis of subsurface soil from a new deep borehole to be placed within 216-A-30 Crib will be evaluated in association with 216-A-37-2.

## Potential Viable Alternatives

Table AD-8. Data-Needs Priority  
 Summary – Model Group 6 – 216-A-37-2 Crib  
 (200-CW-5/2/4/200-SC-1) (RL/FH) (CPP) (EPA). (2 Pages)

Background																																																																																																																																																																																													
Site Identification	216-A-37-2 Crib																																																																																																																																																																																												
Site Location	200 East Area; PUREX Zone; outside 200 East Area perimeter fence, east of the 202-A Building																																																																																																																																																																																												
Type of Site	Crib																																																																																																																																																																																												
Operating History	<p>The crib is marked with concrete AC-540 posts and Underground Radioactive Material signs. The crib was built as a replacement for the 216-A-30 crib. The crib received PUREX steam condensate waste. There are two steel drain pipes. One is perforated and runs the length of the unit, and the other is unperforated and runs from west to east only to the center of the unit, 1.5 m (5 ft) above the bottom. Two vents are located at the center and at the east end. Two liquid-level gage wells are located 106 m (350 ft) from the ends of the unit. A bed of gravel on the bottom has been covered with a 20-mil polyvinyl chloride barrier cover.</p> <p>The crib is 1,400 ft long, 10 ft wide at the bottom, and 16 ft deep. The waste site received 1,090,033 m<sup>3</sup> of liquid effluent and operated from 1983 to 1995.</p> <p>Site Inventory Model – 216-A-37-2 Crib (RPP-26744) (some constituents of interest are  Summary – Model Group 6 – 216-A-37-2 Crib  
 (200-CW-5/2/4/200-SC-1) (RL/FH) (CPP) (EPA). (2 Pages)

Vicinity Waste Sites	216-A-30, 216-A-37-1						
Status	Analogous site; assigned to 216-U-10; evaluated in 200-PW-2/4 feasibility study (DOE/RL-2004-24); capping identified as preferred alternative in feasibility study.						
Potential Remedial Alternatives							
X for Viable Alternatives	No Action	MESC//MNA/IC	Removal/Disposal	Barrier	Partial Removal/Barrier	In Situ Treatment	Other
	X	X	X	X	X		
Data Evaluation and Gaps Analysis							
Data	Knowns	Data Uncertainties	Are supplemental data required to support decision making?				
No site-specific sampling or geophysical logging information  Borehole C4106 at 216-A-37-1 was drilled to the water table and provides information on deeper contamination in the area of the 216-A-37-1 and 216-A-37-2 Cribs.		Nature and extent of contamination at 216-A-37-2; inventory indicates minor contamination.	No. Inventory data and data from supplemental investigation activities at 216-A-30 (proposed) will support decision making at the 216-A-37-2 Crib (216-A-37-2 replaced the 216-A-30 Crib). Because existing wells are located within the waste site, geophysical logging is an opportunistic method of collecting site-specific data to help confirm inventory knowledge for gamma-emitting radionuclides and to support decision making. HRR surveys in this area also will provide information on the potential for deeper mobile contaminants.				
<b>Proposed Activities and Path Forward:</b>							
No supplemental data collection activities are required. Data collected from 216-A-30 will be used to support evaluation of 216-A-37-2.							
Geophysically log 299-E25-21, -23, and -24 to obtain opportunistic site-specific information.							
Reevaluate data needs following assessment of the 216-A-30 supplemental investigation data and any additional information collected for 216-A-37-1 (a Washington State Department of Ecology treatment, storage, and/or disposal site).

Sample Collection Methodology	Sample Location	Maximum Depth of Investigation	Sample Interval Depth (ft bgs) <sup>a</sup>	Analyte List <sup>b</sup>	Physical Properties	
					Sample Interval	Parameters
Borehole drilling and sampling	One new borehole near the inlet end of crib	To water table (~275 ft bgs)	Split-spoon sample intervals: 1 – 3.5 ft bgs 3.5 – 6 ft bgs 15 – 17.5 ft bgs 85 – 87.5 ft bgs 122.5 – 125 ft bgs TD (~272.5 – 275 ft bgs)	Analytes are presented in Volume I, Table A2-3, the 200-CW-5, 200-CW-2, 200-CW-4, and 200-SC-1 columns.	All split-spoon samples	pH, specific conductance, bulk density, moisture, particle-size distribution
			Collect grab samples every 2.5 ft from depth 15 ft bgs to TD. Perform extraction analysis on grab samples, starting with samples every 10 ft.		See Volume I, Table A2-3	N/A
Number of split-spoon samples		6				
Approximate number of field quality-control samples <sup>c</sup>		3				
Approximate number of grab samples		105				
Approximate total number of soil samples collected		113				
Approximate total number of soil samples initially analyzed <sup>d</sup>		36				
Non-Sample Data Collection		Maximum Depth of Investigation				
High-resolution resistivity		Not defined				
Downhole gamma-spectroscopy log, neutron moisture, and passive neutron logs		Surface to TD in new borehole at ~275 ft bgs				

<sup>a</sup> Actual sampling depths may vary depending on the amount of backfill/overburden used in interim-stabilization activities at the waste site, field screening results, and varying subsurface conditions.

<sup>b</sup> See Volume I, Appendix A, Tables A2-1, A2-2, A2-3, and A3-2 for detection limits and other analytical parameters.

<sup>c</sup> One duplicate, one split, and one equipment blank. Field blanks also will be collected for volatile organic analysis, but are not included here.

<sup>d</sup> Samples analyzed include 6 split spoon samples, 27 grab samples, and 3 quality-control samples.

bgs = below ground surface. N/A = not applicable. TD = total depth.

This page intentionally left blank.

Figure AD-16. 216-A-30 Crib  
Conceptual Model and Data Summary.

200-SC-1 Operable Unit  
Waste Type: Steam Condensate

# 216-A-30 Crib

Model Group 6  
PUREX Plant Zone

## History

216-A-30 Crib is a liquid waste disposal site that received contaminated steam condensate, equipment disposal tunnel floor and water-filled door drainage, and fuel slug storage basin overflow from the 202-A Building (PUREX). In 1972, contaminated salt crust formed on the surface of the crib. Contaminated tumbleweeds were subsequently found growing on the crib.

**CONSTRUCTION:** A covered, gravel-filled trench with bottom dimensions of 1,400 feet long by 10 feet wide and about 15 feet deep. Two perforated galvanized pipes run the length of the unit.

**WASTE VOLUME:** 7,500,000,000 liters

**DURATION:** 1961 to 1992.

## ESTIMATED INVENTORY OF SELECTED HIGH-MOBILITY CONSTITUENTS

	WIDS	SIM
Uranium	<41 Kg	656 Kg
U-233	<7.48 g	2.05 Ci
Tritium	10.7 Ci	0.02 Ci
Nitrate	--	208,200 Kg
Chromium	--	6,045 Kg
Fluoride	--	1,128 Kg

## ESTIMATED INVENTORY OF SELECTED MEDIUM/ LOW MOBILITY CONSTITUENTS

	WIDS	SIM
Co-60	16.6 Ci	0.0002 Ci
Cs-137	220 Ci	2.79 Ci
Sr-90	<11.1 Ci	1.10 Ci
Plutonium	<72 g	247.8 Ci
Pu-239/-240	--	41.45 Ci
Pu-241	--	202.7 Ci
Total Beta Emitters	5,440 Ci	--

Note: "--" indicates inventory not estimated.

## REFERENCES:

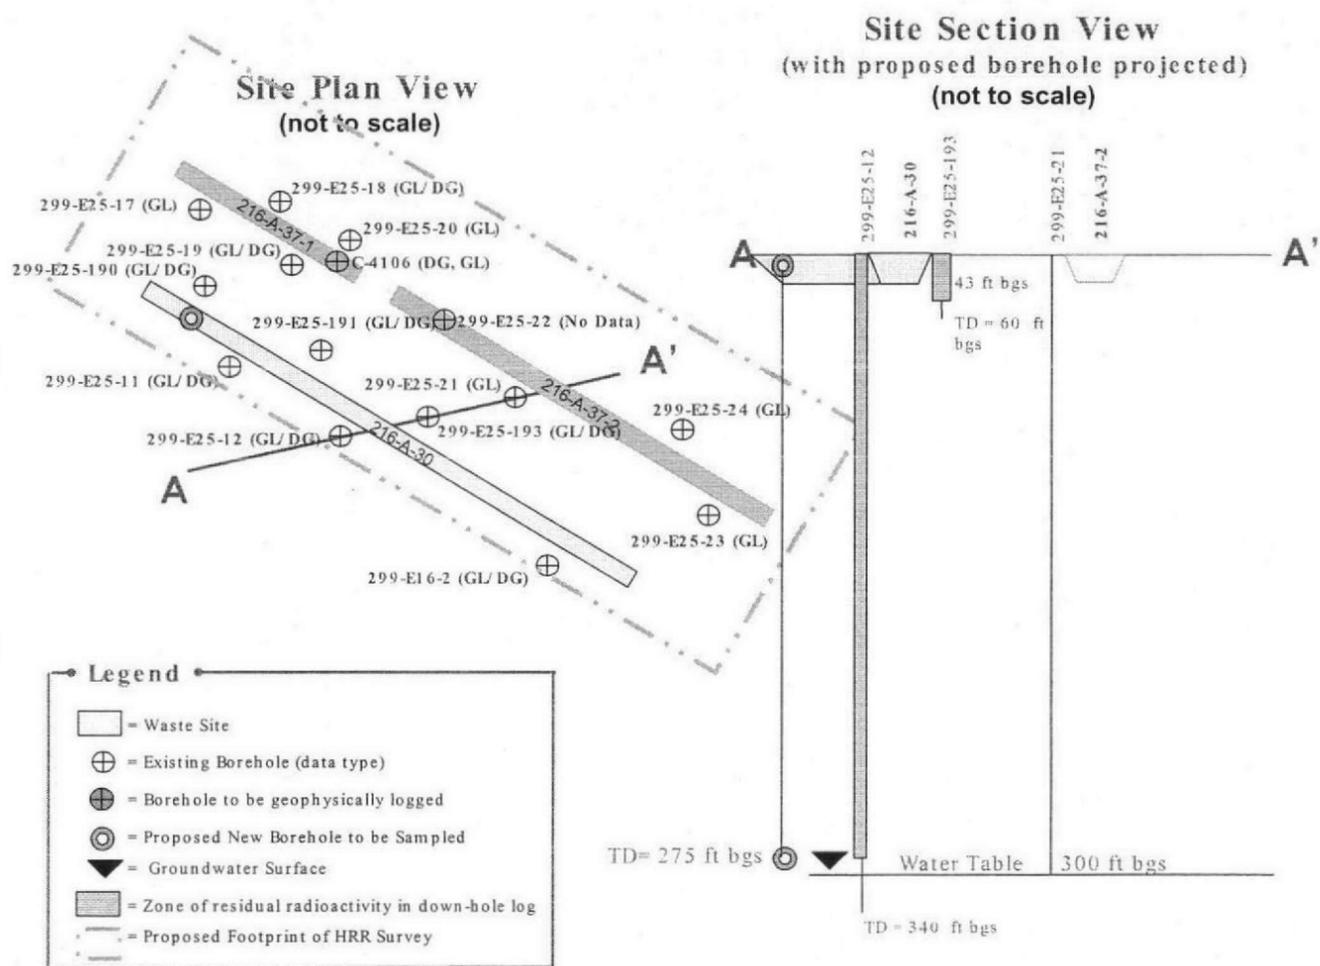

WIDS general summary reports  
Hanford Soil Inventory Model, Rev 1 (RPP-26744)

## Basis of Knowledge

- Process History (PH)
- Interpretation of Downhole Geophysics (DG)
- Geologic Logs (GL)
- Extrapolation from Representative Site (RS)

## Characterization Summary

- Operating history and scintillation log of well 299-E25-12 (adjacent to 216-A-30) suggests potential for deep contamination at relatively low concentrations under 216-A-30.
- Operating history indicates surface contamination along full length of crib.
- Assigned to representative site 216-U-10.

## Data Needs, Rationale, and Investigation Approach

Additional information is required for the following reasons:

- There are uncertainties in the relationship to the representative site (216-U-10) based on geology and inventory.
- Groundwater protection could be a concern based on the site-specific inventory; the full nature and extent of contaminants that may impact groundwater are uncertain (e.g., chromium, fluoride, nitrate).

The supplemental investigation strategy incorporates the following elements:

- A high-resolution resistivity (HRR) survey will support identification of areas of elevated conductivity that may be associated with mobile contaminants.
- One deep borehole will be installed near the head end of the 216-A-30 Crib to collect subsurface soil samples for analysis as specified.
- Data collected from this site will be used to describe expected conditions at 216-A-37-2 and 216-A-6. This is appropriate because these sites all received the same waste; 216-A-6 was replaced by 216-A-30, which was subsequently replaced by 216-A-37-2.

## Potential Viable Alternatives

- MESC/ MNA/ IC ● BARRIER

Table AD-10. Data-Needs Priority  
 Summary – Model Group 6 – 216-A-30 Crib  
 (200-CW-5/2/4/200-SC-1) (RL/FH) (CPP) (EPA). (2 Pages)

Background																																																																																																																																																																										
Site Identification	216-A-30 Crib																																																																																																																																																																									
Site Location	200 East; PUREX Zone; south of 202-A Building inside the PUREX Exclusion Fence, immediately east of 216-Z-6 Crib and adjacent to 216-A-37-1 and 216-A-37-2.																																																																																																																																																																									
Type of Site	Crib																																																																																																																																																																									
Operating History	<p>The crib is surrounded with concrete AC-540 markers and posted with Underground Radioactive Material signs. The unit includes two distribution pipes: one 15-in (38 cm) corrugated perforated pipe running approximately 4 ft (1.2 m) below grade to the center of the unit, the other a 16-in (41 cm) steel pipe running parallel to the other, 4 ft (1.2 m) below grade to the center of the unit, then angling 45 degrees and changing to a 15-in (38 cm) corrugated, perforated pipe running 7 to 8 ft (2.1 to 2.4 m) below grade to the end of the unit. It is filled with 5 ft (1.5 m) or a total of 123,000 cu ft (3,480 m<sup>3</sup>) of gravel, and the site has been backfilled. The side slope is 1.5:1. The crib is associated with PUREX operations. Two 8-inch (20 cm) carbon steel gage wells extending from the bottom to 3 ft (0.9 m) above grade. A 15-inch (38 cm) diameter vent riser extends from the distribution pipe to 3 ft (0.9 m) above grade. Two 16-in (41 cm) by 16-inch (41 cm) by 8-inch (20 cm) concrete pads support the gage wells. 47,720 square feet (4430 square meters) of polyethylene sheets were added. The site is associated with the 216-A-6 Crib. The site received waste between 1961 and 1992. From 1961 to 1966, the 216-A-6 and 216-A-30 Crib were used in parallel; in 1970, the 216-A-6 Crib was abandoned and the effluent was routed to the 216-A-30 Crib. The 216-A-37-2 Crib subsequently was constructed to replace 216-A-30.</p> <p>During the winter of 1971 and early 1972, an alkaline deposit formed over the surface of the 216-A-30 Crib. A radiation survey found the residue to have between 4000 to 6000 disintegrations per minute beta/gamma on the surface. A few tumbleweeds were found measuring 12,000 disintegrations per minute beta/gamma. An exploratory excavation was made into the crib in 1972. Dose rates up to 800 mrad/h were encountered at a depth of 1.2 m (4 ft). It appeared to be a salt deposit condensing out of vapors being emitted from the unit through the porous soil. Corrective actions were taken in June 1972, including covering the ground with layers of sand and plastic. This crib has a history of tumbleweed growing on it and becoming contaminated by absorbing the radionuclides from the crib through their roots. In November 2002, an area measuring approximately 12 by 12 m (40 by 40 ft) was found to have growing contaminated tumbleweeds reading up to 120,000 disintegrations per minute. (WIDS)</p> <p>The crib is 1,400 ft long, and 10 ft wide at the bottom. Construction and historical information would suggest contamination as shallow as 4 to 5 ft bgs. The waste site received approximately 7.5 million m<sup>3</sup> of liquid effluent. Data Evaluation and Gaps Analysis							
Data	Knowns	Data Uncertainties	Are supplemental data required to support decision making?				
Scintillation Logs for Wells: 299-E16-2 (340 ft) (1963, 1968, and 1976)  299-E25-11 (340 ft) (1963, 1968, and 1976)  299-E25-12 (340 ft) (1963, 1976)  Spectral Gamma Logs for Wells: 299-E25-190 (50 ft) (2006) 299-E25-191 (50 ft) (2006) 299-E25-193 (60 ft) (2006)	All three wells are located along the southern edge of the crib. Low-level radioactive contaminants were detected in wells E25-11 and E25-12 in 1963. In 1976, the scintillation probe profiles showed minor activity in all three wells. (ARH-ST-156)  All three wells are located along the northern edge of the crib. All three wells had minor amounts of Cs-137, mostly above 20 ft. Each well had total gamma anomalies beginning ~15 ft deep, which do not correlate with the observed Cs-137 concentrations. Assessment of the logging results indicated the potential for Sr-90 concentrations in excess of 500 pCi/g in these wells. Elevated concentrations extended to a maximum depth of ~43 ft bgs. A moisture log in 299-E25-191 shows elevated moisture content associated with the lower interval of Sr-90 contamination in that well. (Stoller 2006)	Relationship with representative site has some uncertainties related to geology and inventory.  Protection of groundwater could be a concern based on the inventory; site-specific nature and extent of contaminants that may impact groundwater are uncertain.	Yes. The analogous relationship with 216-U-10 is somewhat uncertain. Inventory information would suggest potential for groundwater impacts associated with chromium, fluoride, and/or nitrate. HRR would support evaluation of the lateral extent of potential elevated conductivity that may be associated with mobile contaminants that could impact groundwater. A deep borehole would provide site-specific data on nature and vertical extent and correlation data for the HRR survey results. The data from the 216-A-30 borehole would be used as analogous for 216-A-37-2 and 216-A-6 and associated unplanned releases (these unplanned releases are associated with spills or overflows at the 216-A-6 Crib) because 216-A-37-2 and 216-A-6 received the same waste as 216-A-30. 216-A-6 ultimately was replaced by 216-A-30 and 216-A-37-2 replaced 216-A-30.				
<b>Proposed Activities and Path Forward:</b>							
<ul style="list-style-type: none"> <li>Conduct HRR surveys to evaluate potential for elevated conductivity that may be associated with mobile contaminants and lateral extent of contamination.</li> <li>Install deep borehole to obtain site-specific data that will be used to define nature and vertical extent of contamination and to correlate HRR data.</li> <li>Use data as analogous for 216-A-37-2 and 216-A-6 and associated unplanned releases at 216-A-6 because 216-A-37-2 and 216-A-6 received the same waste as 216-A-30. 216-A-6 ultimately was replaced by 216-A-30 and 216-A-37-2 replaced 216-A-30.</li> </ul>
