Re: **BAT/AKART Study, Decontamination Laundry Facility**

Dear Mr. Izatt:

I have reviewed the "Best Available Technology/All Known and Reasonable Methods of Technology Analysis and Treatability Study Report, Decontamination Laundry Facility, Westinghouse Hanford Facility, Project B-503" submitted to us by your department.

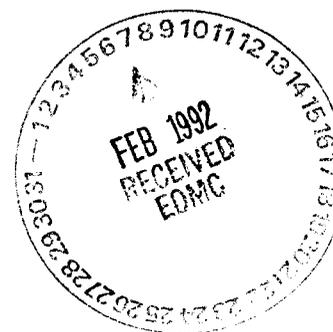

As a practical matter, an AKART study establishes those hazardous substances for which there is no practical treatment (so called exceedances), thus requiring that the usual and statutory limits on these substances be waived.

This report lists a number of exceedances, but does not justify their waiver. I find this report deficient for the following reasons:

This is an end-of-pipe, treat whatever comes out study. The section dealing with source control alternatives is superficial. Any study of this sort should inventory the chemicals used in the process, attempt to trace all unexpected substances encountered and present methods to eliminate toxics from the discharge. Cyanide, TOC, ammonia, hydrazine, arsenic, and vanadium all fall in this category

All exceedances listed were based on the performance of the bench scale test. This is overly conservative. Please approximate the result of routing all suspected hazardous substances through the treatment process.

Insufficient justification is given for eliminating ultrafiltration and selecting the recirculation percentage. Please justify these actions using the AKART procedure.
