Data validation was conducted in accordance with the CHPRC validation statement of work and the Sampling and Analysis Plan for Ex-Situ Plant and Invertebrate Bioassays to Evaluate Terrestrial Environments across the Hanford Site, DOE/RL-2010-118, Draft A, Volume 1 (SAP). Appendices 1 through 6 provide the following information as indicated below:

- Appendix 1. Glossary of Data Reporting Qualifiers
- Appendix 2. Summary of Data Qualification
- Appendix 3. Annotated Laboratory Reports
- Appendix 4. Laboratory Narrative and Chain-of-Custody Documentation
- Appendix 5. Data Validation Supporting Documentation
- Appendix 6. Additional Documentation Requested By Client

## **DATA QUALITY OBJECTIVES**

- **Holding Times and Sample Preservation**

Holding times are calculated from Chain-of-Custody forms to determine the validity of the results. The holding time requirement for ICP metals are analysis within 180 days of sample collection. Sample preservation requires chilling to 4 degree Celsius.

The samples were analyzed within the prescribed holding time and properly preserved with the following exceptions.

All samples except for sample Lab Control ID#3452 were analyzed beyond but within 2X the holding time. All B sample results were detects and should be qualified as estimates and flagged "J-."

- **Blanks**

The blank data results are reviewed to assess the extent of contamination introduced through sampling, sample preparation, and analysis.

### **Laboratory Blanks**

All laboratory blank results were acceptable with the following exceptions.

Three laboratory blanks were included with the samples prepped on 12/15/11. The results for two of the blanks were > the method detection limit (MDL) but < the reporting limit (RL). Based on professional judgment, all sample results that were detects <10X the greatest blank value should be qualified as estimates and would be flagged J+, but were further flagged "J-" due to missed holding time. See the table in Appendix 2 for a listing of all affected sample results.

### **Trip Blanks**

No trip blanks were submitted for validation.

### **Field Blanks**

No field blanks were submitted for validation.

### **Equipment Blanks**

No equipment blanks were submitted for validation.

- **Accuracy**

Accuracy is evaluated by reviewing matrix spike sample results, laboratory control sample results, and ICP-AES interference check sample results. According to the SAP, the matrix spike

sample accuracy limits are 70% to 130% and the laboratory control sample accuracy limits are ones specified by the DV procedure.

### **Matrix Spike/Matrix Spike Duplicate (MS/MSD) Samples**

All MS/MSD recoveries were acceptable with the following exceptions.

Multiple MS/MSDs were included with the samples prepped on 12/15/11 and the parent samples were assessed using their specific MS/MSD results. The MSD1 recovery for B was <70% and the parent sample B2C166 was a detect and should be qualified as an estimate and flagged "J-." The MSD3 recovery was >130% and parent sample B2BYT2 was a detect and should be qualified as an estimate and would be flagged J+, but was further flagged "J-" due to missed holding time. All other associated sample results were detects and since MSD recoveries were both low and high, based on professional judgment all other sample results should be qualified as estimates and would be flagged "J" but were further flagged "J-" due to missed holding time. See the table in Appendix 2 for a listing of all affected sample results.

### **Laboratory Control Samples (LCSs)**

All LCS recoveries were acceptable.

### **ICP-AES Interference Check Samples (ICSs)**

ICS data was not included in the data package. Sample results should not be qualified based on this.

- **Precision**

Precision is evaluated by reviewing MS/MSD results, field duplicate sample results, field split sample results, and ICP serial dilution results. These QC results provide information on the laboratory reproducibility and whether sampling activities are adequate to acquire consistent sample results. According to the SAP, the relative percent difference (RPD) limit is  $\pm 30\%$ .

### **MS/MSD Samples**

All MS/MSD RPD values were acceptable with the following exceptions.

Multiple MS/MSDs were included with the samples prepped on 12/15/11 and the MS3/MSD3 (parent sample B2BYT2) RPD was above the acceptance limit. All sample results were detects and should be qualified as estimates and would be flagged J, but were further flagged "J-" due to missed holding time. It should be noted that if multiple MS/MSDs are performed for a batch, a parent sample is assessed using its specific MS/MSD. Samples that are not parents are assessed using all MS/MSD data presented. See the table in Appendix 2 for a listing of all affected sample results.

**Field Duplicate Samples**

No field duplicates were submitted for validation.

**Field Split Samples**

No field splits were submitted for validation.

**ICP Serial Dilution Samples**

ICS serial dilution data was not included in the data package. Sample results should not be qualified based on this.

- **ICP-MS Internal Standards**

The analysis of ICP-MS internal standards is used to determine the existences and magnitude of instrument drift and physical interferences. The criteria for evaluation of internal standard results apply to all samples (including QC) analyzed during the analytical run, beginning with the calibration.

ICP-MS internal standards data was not included in the data package. Sample results should not be qualified based on this.

- **Detection Limits**

Reported MDLs are compared against the contractually required detection limits (CRDLs) to ensure that laboratory detection limits meet the required criteria.

All reported sample MDLs were below the CRDLs.

- **Completeness**

SDG K3356 was submitted for validation and verified for completeness. Completeness is based on the percentage of data determined to be valid (i.e., not rejected). The completion percentage was 100%.

**MAJOR DEFICIENCIES**

None found.

**MINOR DEFICIENCIES**

Minor deficiencies leading to qualification of sample results as estimates were due to laboratory blank infractions, matrix spike infractions and poor MS/MSD precision. See the table in Appendix 2 for a listing of all affected sample results.

It should be noted that the ID for sample B2C010 was incorrectly logged in as BCC010. The Inorganic Analysis Data Sheet was corrected.

### **Glossary of Data Reporting Qualifiers**

Qualifiers that may be applied by data validators in compliance with the CHPRC statement of work are as follows:

- **U** — The constituent was analyzed for, but was not detected. The data should be considered usable for decision-making purposes.
- **UJ** — The constituent was analyzed for and was not detected. Due to a quality control deficiency identified during data validation the value reported may not accurately reflect the RL. The data should be considered usable for decision-making purposes.
- **J** — Indicates the constituent was analyzed for and detected. The associated value is estimated due to a quality control deficiency identified during data validation. The data should be considered usable for decision-making purposes.
- **J+** — Indicates the constituent was analyzed for and detected. The associated value is estimated with a suspected positive bias due to a quality control deficiency identified during data validation. The data should be considered usable for decision-making purposes.
- **J-** — Indicates the constituent was analyzed for and detected. The associated value is estimated with a suspected negative bias due to a quality control deficiency identified during data validation. The data should be considered usable for decision-making purposes.
- **N** — The analysis indicates the presence of an analyte that has been tentatively identified.
- **NJ** — The analysis indicates the presence of an analyte that has been tentatively identified and the associated numerical value represents its approximate concentration.
- **NJ+** — The analysis indicates the presence of an analyte that has been tentatively identified. The associated value is estimated with a suspected positive bias due to a quality control deficiency identified during data validation.
- **NJ-** — The analysis indicates the presence of an analyte that has been tentatively identified. The associated value is estimated with a suspected negative bias due to a quality control deficiency identified during data validation.
- **UR** — Indicates the constituent was analyzed for and not detected; however, due to an identified quality control deficiency the data should be considered unusable for decision-making purposes.
- **R** — Indicates the constituent was analyzed for and detected; however, due to an identified quality control deficiency the data should be considered unusable for decision-making purposes.
