PREFACE

Documents produced for federal agencies must provide measurement standards according to the International System of Units (SI), which is also known as the metric system. Much of the work described by this document was performed and reported using non-metric units. The following chart is provided to meet readers' needs for conversions between units.

1.0 INTRODUCTION

This report provides a consolidated reference for 1995 concrete sampling data associated with the Hanford Site's 183-H Solar Evaporation Basins. Previous site data have been reported in *RCRA Closure Data Evaluation Report: 183-H Solar Evaporation Basins Soil and Concrete* (DOE-RL, 1995a). In 1995, the 183-H Basins were decontaminated and dismantled. Sampling efforts began after completion of concrete decontamination efforts. Concrete structures (walls and floors) and drummed waste were sampled between August 24 and November 1, 1995. One soil sample from the east berm outside Basin No. 1 was collected concurrently with concrete sampling. Additionally, one water sample was collected during this period to disposition rainwater that accumulated before sampling the decontaminated basin floors. Sampling is described in chronological order. Radiological release surveys of the decontaminated basin walls and floors have been included for completeness.

1.1 BASIN HISTORY AND REGULATORY STATUS

The 183-H Solar Evaporation Basins were located in the 100 Area of the Hanford Site, north of the retired 105-H Reactor (Figure 1-1). They consisted of four adjoining concrete basins. Originally the basins were built as part of the 100-H water treatment structures. They were constructed in 1949 and used for 100-H Area water treatment until the mid-1960s (BHI, 1995a). Most of the water treatment structures, including 12 additional adjoining basins, were demolished in 1974 (DOE-RL, 1995b). The four remaining basins were inactive until 1973 when radioactive and dangerous (mixed) waste from the 300-Area Fuel Fabrication Facility was shipped to the basins for storage and treatment. The basins were used for solar evaporation of the waste, hence the name "183-H Solar Evaporation Basins." The last shipment of waste to the 183-H Basins took place in November 1985 (DOE-RL, 1995b).

The contiguous basins have been designated an interim-status storage, treatment, and/or disposal facility (TSD) unit under the Resource and Conservation Recovery Act of 1976 (RCRA). The unit is being closed in compliance with the *Hanford Federal Facility Agreement and Consent Order* (Tri-Party Agreement) (Ecology et al., 1996) and by requirements of the Hanford Site RCRA permitting process.

The 183-H Solar Evaporation Basins stored and treated RCRA listed waste as well as characteristic and criteria-regulated waste. A "contained-in" determination was made by DOE-RL in order to remove the listed waste designation from the concrete. The determination concluded that listed waste designations could be removed from the concrete if analysis proved that dangerous waste constituents did not exceed Model Toxics Control Act Method C industrial standards and if concrete scabbling residue would be disposed at a disposal unit within the Hanford Site's 200 Area Plateau. This determination is consistent with the Washington State Department of Ecology's (Ecology) contained-in policy for contingent management. Scabbled concrete was determined to be releasable as nondangerous waste after analytical determination that the concrete was not characteristic or criteria-regulated dangerous waste.

Potential hazardous substance contamination in the 100 Area is being addressed under the authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). Area waste sites have been assigned to geographic operable units. The 183-H Solar Evaporation Basins have been assigned to the 100-HR-1 source operable unit. (The groundwater operable unit beneath this source is the 100-HR-3 unit.) The U.S. Environmental Protection Agency (EPA) oversees all Hanford CERCLA activities.

1.2 BASIN STRUCTURE RELATIVE TO SAMPLING

Understanding the basins' structure and general site characteristics is helpful to understand sampling described in this report. Sampling was primarily concerned with basin cement surfaces formerly in contact with regulated mixed wastes. This consisted of interior basin surfaces. Facility dimensions and layout are shown in Figures 1-2 and 1-3. (Dimensions are shown in both feet and metric equivalents because supporting data in the appendices was recorded in feet.)

The four open basins were aligned in series as a single, partially above-ground structure. Each 650-square meter (m²) concrete basin consists of an upper flocculation reservoir on the north side and a deeper sedimentation reservoir on the south. The basin walls are about 15 centimeters (cm) thick and the floor is at least 13 cm thick (Rasmussen, 1995). Interior walls are sloped at the bottom where the walls join the floor. Decontamination (scabbling) of interior walls removed contaminated concrete surfaces; approximately 6 millimeters (mm) of surface material were removed and transferred to waste drums. Radiological surveying and decontamination processes of the lower portions of the interior basin surfaces (those potentially exposed to the former basin wastes) were delineated in 0.6-meter (m) by 2.4-m (2-ft by 8-ft) sections and numbered with paint.

Sampling was performed between August and November 1995 to support demolition activities. Site samples described in this report can be classified into three basic groups: concrete structure, waste drum, and environmental media samples. Concrete structure samples were collected from suspected clean concrete surfaces. Waste drum samples were collected from drums of basin decontamination wastes. Both structure and waste samples consisted of fine, pulverized concrete generated by the scabbling process. Environmental media samples were incidental soil and water samples collected during concrete sampling.

Initial sampling in August 1995 began on the decontaminated interior basin walls, an overflow flume, and an exterior soil berm. The overflow flume was located above the south end of the sedimentation basins and served the four basins in common. (Refer to Figure 2 cross section.) Waste was never known to be present at depths that would have caused waste to contact (and contaminate) the overflow flume. A low point in the overflow flume occurred adjacent to Basin No. 1.

Soil was bermed against the lower portion of the exterior walls at the facility. Previous site work included soil sample collection and analysis (DOE, 1995a). One additional soil sample was collected from the berm east of Basin No. 1 during the August 1995 sampling.

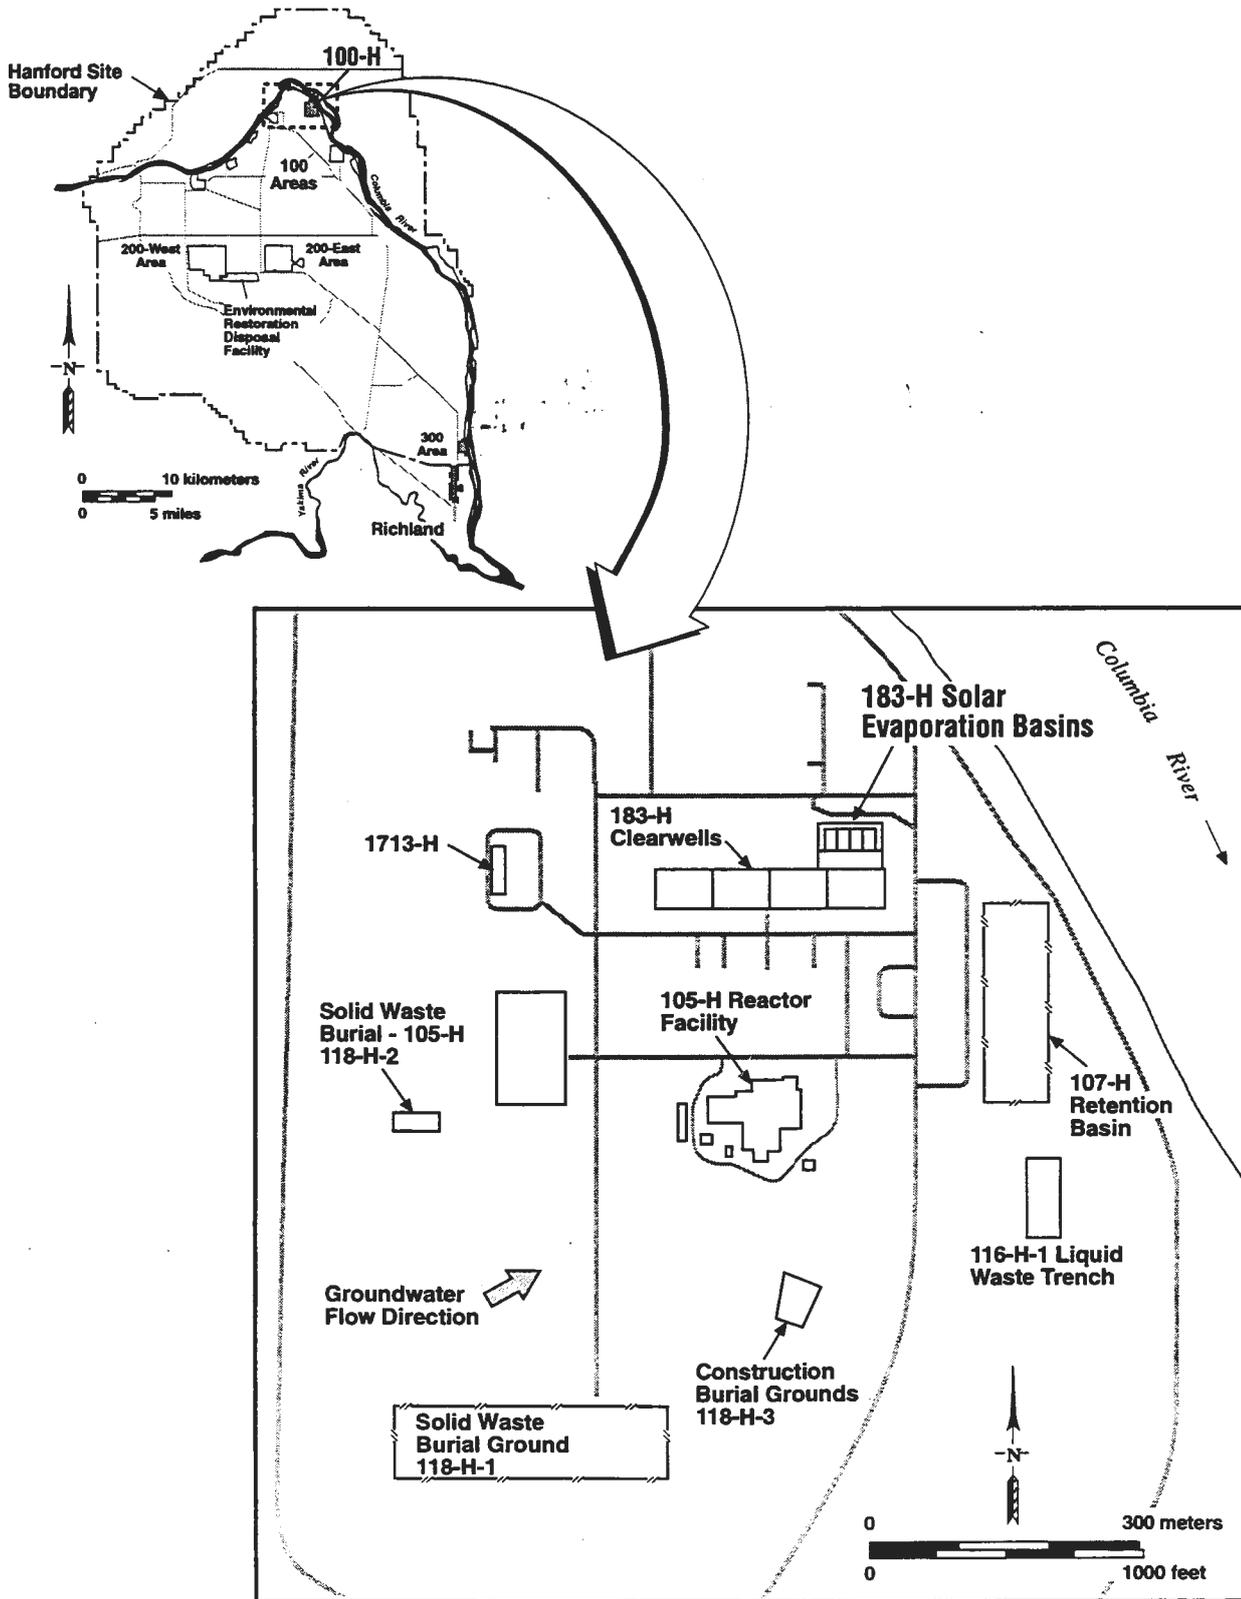

Decontamination of the interior walls and floors generated drummed wastes which were stored on site. Waste drums were sampled for characterization in September and October.

Decontaminated basin floors were sampled last. This final phase of sampling took place in October and November. Though the climate of the region is dry, there was some accumulation of precipitation in the basins after decontamination but before floor sampling was completed in the fall of 1995. Precipitation was pumped to Basin No. 2. After collection and analysis of the accumulated precipitation, sampling of the interior floor surfaces was completed.

2.0 FIELD SAMPLING

Concrete sampling field work (Phase I sampling) began August 24, 1995, after basin surface decontamination. Phase I work consisted of sampling the decontaminated structure and the drummed, segregated, decontamination wastes. The objective was to characterize material that had been removed from the 183-H basin surfaces during the decontamination process to (1) ensure that remaining concrete had been adequately decontaminated and to (2) verify that a flume in the basin's southern wall had never been contaminated by regulated wastes. A sampling and analysis plan was developed by the Environmental Restoration Contractor (ERC) in consultation with the Washington State Department of Ecology (Ecology), EPA, and the U.S. Department of Energy (DOE) (Rasmussen, 1995). The written sampling and analysis plan was augmented with additional concrete wall and drum sampling during implementation.

Samples were collected by Westinghouse Hanford Company's (WHC) Sampling and Mobile Laboratories (SML) personnel on August 24 and 25, September 14, October 23, and November 1, 1995. The work was performed for the DOE under the direction of the ERC. Samples were collected using a clean, air-driven rotohammer to grind off surface concrete from predetermined locations inside the 183-H Basins. Sample wall material was collected in plastic bags that were taped to the wall below the sample sites. Sample floor material was simply accumulated adjacent to the area from which sample was ground. The sample media was then transferred to clean sample bottles for transport and subsequent analysis. The SML personnel referenced the wall sample locations by using the same numbered grids established for radiological survey purposes.

Waste drum sampling of pulverized surface concrete collected by the decontamination process was conducted by ERC personnel on September 29, October 2, and October 3, 1995. Samples were collected using clean stainless-steel spoons.

Table 2-1 is a consolidated Phase 1 sample key. The table provides a list of all field samples associated with this report.

2.1 BASIN STRUCTURES--AUGUST 1995

Basins No. 1 and No. 4 were sampled August 24, 1995, by SML personnel. Sampling was completed August 25 on a flume area. (Basins are numbered from east to west. Number 1 is the furthest east.) Samples were collected in multiple jars to meet analytical needs. Aliquots were assigned Field Assessment Services Team (FAST) sample identification numbers (S-series) or Hanford Site 222-S laboratory sample numbers (N-series).

Two representative locations on the decontaminated Basin No. 1 walls were sampled. Samples from the south wall, 1.5 m above the basin floor were numbered S5060-01 and N5850. Samples from the east wall, 1.2 m above the basin floor were numbered S5060-02 and N5851.

Additionally, on August 25, samples S5060-05 and N5855 were collected from a single untreated 0.4 m² location on the floor of the flume adjacent to Basin No. 1.

Likewise, two locations on the Basin No. 4 walls were sampled. Samples from the south wall location, 0.9 m down below the top of the scabbled area, were numbered S5060-03 and N5852. Samples from the west wall location, also 0.9 m below the top of the scabbled area, were numbered S5060-04 and N5854. (Author's Note: Samplers occasionally referenced sample locations from the edge of the dark area where the basin liner had not been removed. Based upon ERC Radiological Survey Records, this upper reference line would have been more than 2.4 m above the sedimentation basin's floor.)

Samples were delivered to the WHC FAST, the Hanford Site 222-S Laboratory, and the ERC's Environmental Analytical Laboratory (EAL) for analysis. Analyses and results are discussed in subsequent chapters.

The scope of work assigned to WHC included preparation of a letter report documenting their sampling work. Appendix A contains the report for the WHC August work, including a confirmatory soil sample collected with a clean stainless-steel spoon from outside basin No. 1's east wall.

2.2 BASIN STRUCTURES--SEPTEMBER 1995

The walls of Basins No. 2 and No. 3 were sampled September 14, 1995, by SML personnel. Aliquots were again assigned FAST sample identification numbers (S-series) or Hanford Site 222-S Laboratory sample numbers (N-series). Sampling was supported by the same Sample Authorization Form (SAF), S5-060 used for the August work.

Sample locations were selected at random from basin walls. The south wall of Basin No. 2 was sampled at a representative location 0.3 m below the top of the scabbled area. Samples from Basin No. 2 were numbered S5060-07 and N5937. Basin No. 3 was also sampled along the south wall, 4.9 m from the east side and 0.6 m from the basin floor. Samples from Basin No. 3 were numbered S5060-08 and N5936.

Samples were delivered to the FAST, the 222-S Laboratory, and EAL for analysis. Analyses and results are discussed in subsequent chapters.

The scope of work assigned to WHC included preparation of a letter report documenting their sampling work. Appendix B contains the report for the September work.

2.3 WASTE DRUMS--SEPTEMBER/OCTOBER 1995

Surface concrete removed from the 183-H Basin walls had been placed in waste barrels during decontamination work. Sampling was performed September 29, October 2 and 3, 1995, by ERC personnel to verify chemical and radiologic waste drum contents for waste disposal purposes. This sampling was supported by SAF B95-106.

Five drums from each basin were selected for sampling. In addition, a duplicate sample was collected from a Basin No. 2 drum. Samples were collected using clean stainless- steel spoons then were placed in multiple new, vendor-cleaned sample containers. Media for the duplicate and associated regular sample were mixed in a clean stainless-steel bowl before being allocated to sample containers. Separate clean spoons were used for each drum sampled, and samples were assigned a unique Hanford Environmental Information System (HEIS) numbers. Aliquots destined for analysis at 222-S Laboratory were assigned 222-S numbers.

2.4 BASIN FLOOR STRUCTURES--OCTOBER 1995

On October 6, a sample (B0GTS1) of rainwater was collected by ERC samplers from Basin No. 2. The purpose was to confirm radiological characterization for appropriate disposal of the water. Sampling was supported by ERC SAF B96-002. Recently accumulated basin rainwater was pumped to Basin No. 2, before sampling, for consolidation. The basins had been decontaminated, but the process not completed to release the structure from radiological controls. Aliquots were collected by filling a 500-milliliter, pre-cleaned glass sample bottle and pouring into seven plastic containers for shipment to the analytical facilities. Hydrochloric acid was mixed with the water for technetium-99 (^{99}Tc) analysis. Nitric acid was mixed with water for gross alpha, gross beta, total uranium, and gamma spectral analyses. No preservative was mixed with the water for total activity analyses. Aliquots were delivered to 222-S and to Quanterra for quick-turnaround analysis.

Basin floor concrete sampling in Basins No. 2, No. 3 and No. 4 took place on October 23, 1995. Sampling was again performed by WHC SML personnel under the direction of the ERC. Sampling was supported by ERC SAF B96-026.

Based upon the sampling plan (Rasmussen, 1995), two locations, one random and one authoritative, were sampled in each basin. Multiple containers were filled at each sample location. Following are the random locations that were sampled:

- Basin No. 2: 4.6 m south of the north flocculation basin wall, 1.5 m from the east wall (sample BOGRK3)
- Basin No. 3: 12.2 m north of the south basin wall and 3.0 m from the west wall (sample B0GRK6)

- Basin No. 4: 12.2 m south of the flocculation basin and 3.0 m from the west wall (sample B0GRK8).

Note: The Basin No. 2 random floor sample came from the (upper) flocculation basin area while remaining samples were taken from (lower) sedimentation basin areas.

The authoritative locations sampled follow:

- Basin No. 2: 10.1 m south of the flocculation basin wall at the base of the west wall, (sample B0GRK4)
- Basin No. 3: 0.9 m south of the flocculation basin and 7.6 m from the east wall, (sample B0GRK5)
- Basin No. 4: 0.9 m south of the flocculation basin and 9.1 m from the west wall, (sample B0GRK7).

Before using the rotohammer, silica sand was poured over the clean tool head and collected as an equipment blank (sample B0GRK0). Samplers supplied the sand. The tool was field decontaminated following WHC procedures (WHC 7-7, EII 5.4) (WHC, 1988) between samples. A duplicate and split sample were also taken from the randomly selected Basin No. 4 location. The split sample, B0GRL0, was shipped for independent off-site analysis by Quanterra, Inc. Remaining basin structure samples were shipped to on-site laboratories. Results were reported directly to the ERC from the off-site laboratory.

On October 23, 1995, Basins No. 1 and No. 4 had standing water over areas planned as sampling points—temporarily delaying sampling. Basin No. 1 was pumped and the concrete floor sampled that same day. The floor was reported moist at the time of sampling (Appendix C). Samples were assigned HEIS sample numbers, except aliquots destined for 222-S, which were assigned 222-S numbers. Samples were delivered to 222-S, FAST, EAL and Quanterra for analysis. Analyses and results are discussed in subsequent chapters.

The scope of work assigned to WHC included preparation of a letter report documenting their work. Appendix C contains the report for WHC's October and November 1995 work.

2.5 BASIN FLOORS STRUCTURES—NOVEMBER 1995

Floor sampling for Basin No. 1 took place on November 1, 1995. This was an extension of October 1995 sampling of the other basin floors. Sampling was performed by WHC SML personnel under the direction of the ERC. Sampling was again supported by ERC SAF B96-026.

Based upon the sampling plan (Rasmussen, 1995), two locations in the basin were sampled. Multiple containers were filled with material from each sample location. The randomly selected location was 15.2 m south of the flocculation basin and 6.1 m from the east wall, (sample

B0GRK2). The authoritatively selected location sampled was 4.6 m south of the flocculation basin and 1.5 m from the east wall (sample B0GRK1).

Samples were assigned HEIS sample numbers, except aliquots destined for 222-S, which were assigned 222-S numbers. Samples were delivered to 222-S, FAST, EAL and an off-site laboratory (Quanterra) for analysis.

The scope of work assigned to WHC included preparation of a letter report documenting their work. Appendix C contains the report for the October and November 1995 sampling and chemical analyses. It does not include radiological results from aliquots delivered to EAL, 222-S Laboratory or Quanterra.

3.0 ANALYSIS AND VALIDATION

Sample aliquots were submitted to on-site or to off-site laboratories for chemical and/or radiological analysis. No field analysis, other than radiation surveys, were performed during Phase I concrete sampling. This section briefly discusses the analyses and analytical groups for Phase I sampling.

Off-site analysis was used for drummed waste concrete samples, a basin concrete structure split sample, and the rainwater sample. On-site analysis was used for the cement structure samples and the soil berm sample. All samples, whether destined for subsequent on-site or off-site analysis, were supported by a 222-S Laboratory radiological, total activity analysis.

3.1 ON-SITE LABORATORIES

Results were reported via one of three on-site analytical groups (222-S Laboratory, FAST, or EAL). The 222-S Laboratory and EAL were used for radiological analyses. The FAST was used for chemical characterization.

3.1.1 222-S Laboratory

The 222-S Laboratory is operated for the DOE by WHC. All sample aliquots assigned N-series numbers were submitted to the 222-S Laboratory for a radiological total activity analysis. This analysis was performed to ensure associated samples would be shipped and controlled in compliance with applicable radiological requirements. It is a scintillation-based radiological method. All samples were reported at the minimum laboratory-reported concentration of <50 picocuries per gram ($\mu\text{Ci/g}$).

3.1.2 Field Assessment Services Team

FAST-reported samples were analyzed according to WHC internal procedures (WHC internal laboratory-specific procedures are identified in Appendices A, B, and C). These project samples have "FTxxx-xx" alias sample identifications in the Phase 1 Field Sample Key (Table 2-1). Table 3-1 lists EPA methods referenced by FAST. Method references have been corrected from those appearing in the initial letter reports based on personal communication with WHC Special Analytical Studies personnel (Appendix D).

Aliquots from the August and September 1995 samples were submitted for "Total metals TCLP (Toxicity Characteristic Leachate Procedure), ANIONS (EPA 300.0), F, Cl, NO₂, NO₃, SO₄, PO₄, chromium +6, pH, cyanides, sulfide, and formate" (Appendices A and B). Chemical characterization was performed by FAST. No formate analyses were reported by FAST.

August sample digestions for metals analyses were performed by FAST and the extracts shipped to the WHC Waste Sampling and Characterization Facility (WSCF) laboratory for concentration measurements. Measurements from WSCF were reported by FAST (Appendix A).

All FAST-reported sampling results for arsenic, barium, cadmium, chromium (total), lead, selenium, and silver, reference EPA Method 3051 (EPA, 1986). This method is a preparatory digestion method that was performed in lieu of a TCLP preparation. The sample analysis requests for "Total metals TCLP" were interpreted as routine total analyses (incorporating Method 3051) for the TCLP metal analytes listed above.

Similar chemical analyses were performed on the October and November 1995 basin wall and/or floor samples. Split sample B0GRL0 was the only basin structure (wall or floor) sample not analyzed by FAST. This quality control sample was shipped off site for analysis, and the results were reported directly to ERC from the off-site laboratory.

3.1.3 Bechtel Hanford Inc., Environmental Analytical Laboratory

Aliquots of all samples characterized by FAST were submitted to the EAL for the following radiological determinations: gamma energy analysis (GEA), gross alpha, gross beta, uranium-234 (^{234}U), uranium-235 (^{235}U), uranium-238 (^{238}U), total uranium, and ^{99}Tc . BHI internal, laboratory-specific procedures were used. A spectral GEA was used to measure gamma-emitting radionuclides. Gross alpha and gross beta were ascertained by scintillation methods. Technetium-99 concentrations were derived using residual beta estimates.

Waste drum samples were not analyzed by the EAL. Waste drum samples were sent to off-site laboratories for both radiological and chemical analysis. Lower constituent detection limits were a factor in this decision.

3.2 OFF-SITE LABORATORIES

Analyses were performed by one off-site laboratory contractor at its multiple facilities. Quanterra Environmental Services (QES) performed the analyses. Samples were delivered to the QES Richland Laboratory, then transferred as necessary to the QES St. Louis, Missouri, facilities for chemical analysis. Established protocols were followed for off-site analysis and reporting. Off-site analyses were coordinated through the ERC's Sample Management organization.

Aliquots of all drummed waste concrete samples, the concrete structure split sample from the basin floor, and the water sample were shipped for off-site analysis. Radiological analysis was performed at the QES Richland Laboratory; chemical analysis was performed at the QES St. Louis facility. Only radiological analyses were required for water sample B0GTS1.

Sample aliquots were submitted for the following radiological determinations: GEA, gross alpha, gross beta, ^{234}U , ^{235}U , ^{238}U , total uranium, and ^{99}Tc . Total uranium was requested for water sample B0GTS1 whereas the uranium isotopic analysis was requested for the waste drum samples. Both total and isotopic uranium analyses were performed on the concrete structure sample. Radionuclide results reported by QES use "DA" when activity of a daughter was used to estimate a parent nuclide concentration. One nuclide, ^{238}U , was also reported with the suffix "DLP." This indicates that a more closely related, but lower yielding (less sensitive), daughter was used than in the "DA" estimate.

Chemical analyses requested by off-site laboratories are listed by reference method in Table 3-2. Requested chemical analytes for the solid matrices were identical except for vanadium, formate and hexavalent chromium. Formate and vanadium analyses were requested only on the waste samples. Hexavalent chromium was requested only on concrete structure split samples. Additionally, arsenic, lead, selenium, and thallium analysis was requested using the atomic absorption methods (EPA 7000 series) for the split sample.

Laboratory instructions were revised in early November 1995. A TCLP metals analysis was requested on four samples held by the laboratory: B0GNX7, B0GNY0, B0GNY2, and B0GNY4. Project needs dictated adding TCLP analysis primarily for additional chromium and lead information.

3.3 VALIDATION

All chemical and radionuclide project data packages from QES were validated by Golder Associates, Inc., under subcontract to the ERC, with one exception: rainwater data. The validation was conducted at level C in accordance with validation procedures (WHC 1993a, 1993b). The validation reports and their supporting data appear in Appendices G through I and K. Additional laboratory quality control data are available and are contained in original records received from the off-site laboratories; however, they are not routinely included in validation packages nor routinely delivered to project leads.

Data packages from FAST were validated by WHC. FAST reported validation for about half of the samples analyzed, (see data validation sections of Appendix A and B). While data qualifiers have been discussed, WHC did not include qualifiers in the summary data tables of the respective WHC reports. Data validation was not reported for samples shown in Appendix C, which consists primarily of sedimentation basin floor samples.

Analytical results from the 222-S Laboratory and the EAL were not independently validated. Both laboratories performed only radiological analyses.

Table 3-1. On-site Analytical Chemistry Methods

Determination	Referenced EPA Method	Comment
Metals: arsenic, barium, cadmium, chromium, lead, selenium, silver	3051/6010	3051 is a microwave digestion procedure, not equivalent to a TCLP extraction.
Anions: fluoride, chloride, nitrite, nitrate, sulfate, phosphate	300.0	
Mercury	7471	October/November narrative inaccurately reports mercury as an inductively-coupled plasma metal and also references EPA method 7470. Method reference number corrected per Appendix D.
Cyanide	9010	
Sulfide	9030	
Hexavalent chromium	7196A	
pH	9045	

EPA = U.S. Environmental Protection Agency

TCLP = Toxicity Characteristic Leachate Procedure

^bRequested October 31, 1995, on B0GNX7, B0GNY0, B0GNY2, and B0GNY4 only.

**THIS PAGE INTENTIONALLY
LEFT BLANK**

4.0 SAMPLING AND ANALYSIS RESULTS

The five tables presented in this section to summarize the data are based on the routine samples and do not include field blank, duplicate, or split sample results (those results are presented and discussed in the Section 5.0). Supporting data, including the results for any particular sample, can be found in the appendices.

Appendices A through D present supporting information about the concrete structure samples, sand equipment blank, and soil sample analyzed by FAST. Appendix E provides reproductions of all 222-S Laboratory sample reporting. Appendix F provides two ERC memorandums containing all EAL sample results for the concrete structure samples, sand equipment blank, and soil sample.

Samples shipped off site for analysis are grouped into sample delivery groups (SDG) for laboratory analysis and reporting. Waste drum samples were divided into three SDGs containing the following samples:

W0747-QES

B0GNX2
B0GNX3
B0GNX4
B0GNX5
B0GNX6
B0GNX7
B0GNX8
B0GNY0
B0GNY1
B0GNY2

W0751-QES

B0GNX9
B0GNY3
B0GNY4
B0GNY5
B0GNY6
B0GNY7
B0GNY8
B0GNY9

W0755-QES

B0GNZ0
B0GNZ1
B0GNZ2

Selected information from the sampling, off-site analysis, and validation processes is combined in data validation packages. Data validation packages are typically organized by SDG and include separate sections for inorganics, radiochemistry, and general chemistry. Appendix G contains the validation package for SDG W0747-QES, and data associated with the October 31, 1995, special request for TCLP analysis on selected samples. Appendices H and I contain results and supporting documentation for W0751-QES and W0755-QES, respectively.

Appendix J reports the water sampling results. Appendix K reports the QES results of the concrete-structure split sample collected concurrently with samples reported by FAST. Appendix L reports radiation field surveys.

Data from off-site laboratories is reported to the ERC in both a hard-copy and an electronic format. The electronic format often reports data with greater precision (i.e., more displayed digits than does the printed copy). Summary tables that include off-site analyses were derived from the electronic data, and the results can be confirmed using the HEIS.

4.1 CHEMICAL CONSTITUENTS OF BASIN CONCRETE STRUCTURES

Table 4-1 summarizes the chemical constituents of the basin concrete structures. Samples of the basin floors and walls were analyzed by FAST. Supporting documentation can be found in Appendices A, B, C, and D.

The summary table lists the number of routine sample results and how many of these were nondetects. The "R"-qualified results were not included in the count of routine results but are noted in the endnotes. The numerical minimum and maximum concentrations have been reported, (despite the fact the values may be a qualified). Some nondetected values were reported variously as "ND" or "<" values in FAST reports but have been consistently flagged with "U" in Table 4-1. Other data qualifiers correspond to those discussed in the respective data validation sections of the appendices. An average and sample standard deviation concentration has been provided when samples were reported with numerous detected values. Table 4-1 is based on the routine samples and does not include blank, duplicate, or split sample results.

This report does not compare the 1995 results to any specific criteria. Included here as an aid to the reader are chemical analyte ranges from the 1991 183-H exterior wall background concrete sampling (DOE, 1995a). Qualitative comparisons may be useful, but readers should note historical collection methodology, analytical facilities, and sometimes methods differed between studies.

4.2 CHEMICAL CONSTITUENTS OF DRUMMED WASTE CONCRETE

Table 4-2 presents a summary of chemical constituents of the drummed waste concrete. Samples of the drums were analyzed by QES. Supporting documentation can be found in Appendices G, H, and I. Table 4-2 lists the number of routine sample results and shows how many of these were nondetects. The R-qualified results were not included in the count of routine results but have been noted in the endnotes. The numerical minimum and maximum concentrations have been reported (despite the fact the values may be qualified). Data qualification flags have been included for individual sample results. An average and a sample standard deviation concentration has been provided when samples were reported with numerous detected values. Table 4-2 has been based on the routine samples and does not include blank, duplicate, or split sample results.

This report does not compare the 1995 results to any specific criteria. As an aid to the reader, chemical analyte ranges from the 1991 183-H exterior wall background concrete sampling have been included here (DOE-RL, 1995a). Qualitative comparisons may be useful, but readers should note historical collection methodology, analytical facilities, and sometimes methods differed from newer samples.

4.3 RADIOLOGICAL CONSTITUENTS OF BASIN CONCRETE STRUCTURES

Table 4-3 presents a summary of radiological constituents of the concrete structures. Samples were analyzed by the 222-S Laboratory and the EAL. Supporting documentation can be found in Appendices E and F.

The summary table lists the number of routine sample results and shows how many of these were nondetected. Differences in number of results reported for certain radioisotopes have been based on reporting differences between the two batches of samples. Values reported by the laboratory as "<x" have been summarized as nondetected. The numerical minimum and maximum concentrations have been reported. An average and sample standard deviation concentration has been provided when samples were reported with numerous detected values. Table 4-3 has been based upon the routine samples and does not include blank, duplicate, or split sample results.

Two less sample aliquots were analyzed at the EAL than at the 222-S Laboratory. The final two basin floor samples, B0GRK1 and B0GRK2, were mistakenly not analyzed and reported by the EAL, which has now closed.

4.4 RADIOLOGICAL CONSTITUENTS OF DRUMMED WASTE CONCRETE

Table 4-4 presents a summary of radiological constituents of the drummed waste concrete. Samples of the drums were analyzed by the 222-S Laboratory and QES in Richland. Supporting documentation can be found in Appendices E, G, H, and I.

The summary table lists the number of routine sample results and shows how many of those were nondetects. Data qualification flags have been included for individual sample results. Values qualified as undetected or reported by the laboratory as "<x" have been summarized as nondetected. The R-qualified results were not included in the count of routine results but have been noted in the endnotes. The numerical minimum and maximum concentrations have been reported (despite the fact the values may be a qualified). An average and sample standard deviation concentration has been provided when samples were reported with numerous detected values. Table 4-4 has been based on the routine samples and does not include blank, duplicate, or split sample results.

4.5 SAMPLE RESULTS FOR OTHER MEDIA

Table 4-5 summarizes the soil and water sample collected during the sampling period. The summary table lists individual sample results for both radiological and chemical constituents.

Soil analyses were performed by the 222-S Laboratory, FAST, and the EAL. Supporting documentation for chemical analysis of the soil sample can be found in Appendices A and D. Radiological results for the soil sample can be found in Appendices E and F.

Water analyses were performed by the 222-S Laboratory and QES in Richland. Readers are reminded that the water data were not validated to the same standard as other data in this report. Supporting documentation for the water sample can be found in Appendices E and J.

Table 4-1. Chemical Constituents of Basin Concrete Structures

Analyte	Number of Results/ Nondetects	Minimum	Maximum	Average	Sample Standard Deviation	183-H Concrete Background Range*
Analyzed by WHC Field Assessment Services Team						
Method 3051/6010						
Arsenic (mg/kg)	15 / 15	7 U	13 UJ	NC	NC	42U - 50U

TH232dau is the activity of Ac228, Pb212 and Tl208, short-lived daughter products of Th232.

U238dau is the activity of Pb214 and Bi214, short-lived daughter products of U238.

[] = Value computed using undetected values at reported detection limit.

*The final two basin floor samples, B0GRK1 and B0GRK2, were mistakenly never analyzed and reported by the EAL.

5.0 QUALITY ASSESSMENT FIELD SAMPLES AND DISCUSSION OF RESULTS

Five tables are presented in this section to summarize the field duplicate, split, and silica sand blank samples. These results are useful in the data interpretation process.

This report uses the term "field duplicate" to indicate a field-equivalent sample attributed to a location in common with a routine sample. The field duplicate is submitted to the same analytical facility as the associated routine sample. The term "field split sample" is used to indicate a duplicate submitted to a second (independent) analytical facility for analyses similar to those being performed on the routine sample.

Sample variability is summarized by the relative percent difference (RPD) statistic. This value, expressed as a percent, is the absolute difference between two values divided by their mean. The term expresses variability relative to the size of the measurement--not in absolute terms. Table values showing comparisons between regular and split samples arbitrarily have a "+" (or "-") sign indicating the split results were higher (or lower) respectively.

Additional quality control laboratory samples were analyzed and considered in the validation process. Supporting data can be found in the appendices. Some additional laboratory quality control data is available. It is contained in original records received from the offsite laboratories. However it is not routinely included in validation summary packages nor routinely delivered to project leads.

Similar to the previous chapter, tables and statistics of Quanterra data were derived from electronic laboratory deliverables. These occasionally display more precise concentrations than the laboratory printed data reproduced in the respective validation reports (appendices).

Data users should weigh the relevance of individual quality assessment results. The applied data validation process does not automatically incorporate an understanding of field quality assessment sample results. Though very limited, results offer some insight into the inherent uncertainty of individual sample results.

5.1 CONCRETE STRUCTURE CHEMICAL RESULTS AND DISCUSSION

Table 5-1 summarizes field duplicate and split comparisons for the concrete structure chemical results. Based on the relative percent difference statistic, chromium showed the greatest variability between the regular sample (B0GRK8) and its duplicate (B0GRK9). Nitrate -- RPD 25.8 percent, and chloride -- RPD 20.2 percent, followed respectively. Remaining analytes were associated with RPDs of less than 11 percent or were undetected.

The anions (nitrate, chloride and fluoride) showed the highest variability between the regular sample (B0GRK8) and the split sample (B0GRL0). The split sample was much lower in nitrate than the regular sample, relative percent difference (RPD) 133 percent (168 J versus 828 $\mu\text{g/g}$).

Results for chloride showed an RPD of 53.5 percent with a moderately lower split sample concentration (10.4 versus 18 $\mu\text{g/g}$). Fluoride showed a slightly higher concentration in the split sample with an RPD of 21.1 percent. Absolute differences in the fluoride concentrations were small (6.08 J versus 4.92 $\mu\text{g/g}$). Split sample chromium results were very close to the mean value of sample B0GRK8 and its duplicate. Other routine analytes also had RPDs of <20 percent or were undetected.

Two split sample analytes, ortho-phosphate and selenium, were qualified as rejected in the data validation process. Both results are, however, numerically consistent with routine sample results.

The split sample was analyzed for additional analytes not reported in routine concrete structure samples. Refer to Appendix K for additional results.

5.2 DRUMMED WASTE CONCRETE CHEMICAL RESULTS AND DISCUSSION

Sample analysis of field duplicates showed some widely variable metals results (Table 5-2). Five elements (aluminum, barium, calcium, magnesium, and sodium) were associated with RPDs >100 percent. Chromium, cobalt, copper, iron, manganese, nickel, potassium, and thallium had RPDs ranging from about 48 to 78 percent. Arsenic and zinc had detected concentrations associated with RPDs of <5 percent. Remaining elements, including vanadium, had one or both determinations at nondetected concentrations. Anions, cyanide, sulfide, and pH were in general agreement with RPDs <16 percent.

Silver and ortho-phosphate were undetected but qualified "R" (rejected) in the data validation process. Numerous metallic analytes were reported at concentrations above an instrument detection limit, but they were below the contract detection limit in the duplicate sample. The duplicate sample had aluminum, barium, and magnesium concentrations at less than the routine sample minimum, but chromium, iron, manganese, nickel and thallium concentrations were near routine sample maximums. No waste drum split samples were taken for independent chemical analysis.

5.3 CONCRETE STRUCTURE RADIOLOGICAL RESULTS AND DISCUSSION

Radiological results of the regular sample (B0GRK8) and duplicate sample (B0GRK9) show derived ^{99}Tc had the highest RPD (105 percent) followed by gross beta and gross alpha determinations (Table 5-3). The ^{99}Tc derivation was dependent upon both the gross beta and gross alpha results. It was not a directly measured parameter. Uncertainty in the underlying factors was propagated to the derived value. Gross beta results had an RPD of 78.7 percent (47.9 versus 110 $\rho\text{Ci/g}$); gross alpha had an RPD of 30.8 percent (16.5 versus 12.1 $\rho\text{Ci/g}$).

The regular and duplicate sample had very comparable GEA measurements. Most of the reporting list of analytes were not detected in either the regular or duplicate sample. Those that

were detected were essentially equivalent considering the laboratory-reported uncertainties. For instance, ^{235}U was reported at positive concentrations with an RPD statistic of 24 percent. However, examination shows the values were essentially indistinguishable. Each value falls within the reported 2-sigma uncertainty of the other value.

Split sample results showed that the highest RPD was associated with the gross beta results. The EAL reported substantially higher gross beta results. The QES's values were more in line with the 222-S Laboratory total activity screening. Technetium-99 and gross alpha estimates again showed high RPDs of 62.6 percent and 51.1 percent respectively. The EAL derived higher results than the QES-analyzed split sample.

A measured parameter in the split sample was ^{99}Tc . The QES-reported result was 14.7 $\mu\text{Ci/g}$. This compares to 28.1 and 90.3 $\mu\text{Ci/g}$ for the corresponding regular and duplicate derived ^{99}Tc values. Derivation of the ^{99}Tc values was dependent on the EAL's gross beta estimate.

A naturally occurring isotope, potassium-40 (^{40}K), is the dominant radionuclide reported in both the EAL and QES results.

5.4 DRUMMED WASTE CONCRETE RADIOLOGICAL RESULTS AND DISCUSSION

Table 5-4 summarizes field duplicate and split comparisons for the drummed waste radiological results. The field duplicate RPD is highest for ^{99}Tc (about 60 percent). The regular and duplicate sample at 181 and 97.5 $\mu\text{Ci/g}$, respectively, also exceed the reported gross beta concentrations. The gross beta concentrations of the regular sample (B0GNY5) and duplicate (B0GNY6) drum sample were 31.9 and 41.1 $\mu\text{Ci/g}$. These values each fall outside the reported 2-sigma uncertainty of the other value. The gross beta RPD was 25.2 percent, the second highest calculated for the sample pair. All other determinations had RPDs of about 20 percent or less when positive concentrations were reported.

Concentrations reported for ^{40}K , in both the regular sample and its duplicate, were $<1 \mu\text{Ci/g}$. The regular sample had the minimum reported ^{40}K concentration. The dominant radionuclide reported in the sample pair was ^{99}Tc .

All drum waste aliquots sent to the 222-S Laboratory were reported with total activities of $<50 \mu\text{Ci/g}$. Other waste drum split samples were not taken for independent radiological analysis.

5.5 SILICA SAND ANALYSIS AND DISCUSSION

Results of the clean silica-sand field equipment blank are shown in Table 5-5. Most constituents are near or below detectable concentrations. Sample analysis was performed by FAST and the

EAL in conjunction with other cement structure samples. (See description of October Basin Floor sampling.) The coarse sand was supplied by the sampling team.

The silica sand was poured over the scabbling tool but, according to field descriptions, was not subject to the grinding forces of actual sample collection. Contributions of the collection methodology itself have not been substantially assessed. At least two different types of scabbling tools were reportedly used during the decommissioning effort. The scabbling process could bias results and may contribute to observed differences between current results and other sampling.

6.0 RADIOLOGICAL SURVEYS

In addition to chemical analysis, radiologic field surveys were performed to monitor and control radiologic contamination at the 183-H Basins. Workers and equipment were surveyed during the course of the decontamination efforts. A final release survey was performed on those portions of the basins that met established criteria.

Surface surveys indicated whether radioactive contamination was below the surface release criteria of DOE Order 5400.5, *Radiation Protection of the Public and Environment*, which contains applicable requirements independent of the RCRA TSD closure activity. Cement structures or debris that did not meet the surface release criteria of the order will continue to be subject to radiologic controls. Most walls and floors of the four basins were sufficiently decontaminated to meet release criteria. Surface areas of the north wall and the sedimentation and flocculation floors of Basin No. 1 were not sufficiently decontaminated to achieve release standards as based on surface surveys.

Each survey has been identified by a survey number. Surveys were performed according to the *Radiological Release Plan for the 183-H Basins* (BHI, 1995b). Copies of release surveys for basin walls and floors have been included in Appendix L. Surveys are organized by survey number.

Project Sampling and Analysis Case Narrative

INTRODUCTION

On August 25, 1995, Sampling and Mobile Labs (SML) sampled material from the 183-H Basins 1 and 4 to determine if decontamination of the concrete was successful. Samples were delivered to the Field Assessment Services Team (FAST) as well as the Environmental Analytical Laboratory (EAL)

SAMPLING AND ANALYSIS

Authoritative and random sampling, followed by onsite analysis, was used to confirm decontamination of the 183-H basin surfaces. An authoritative sample was taken to be used to verify the basins never leaked/overflowed into the flume at the south end of the basin. Seven concrete chip samples and one soil sample were obtained for characterization. One sample was authoritatively selected from each basin, based on the previous sampling/analytical results (DOE/RL-95-27) and one sample was randomly selected from each basin, based on the numbered grid of the basins. In addition, one concrete sample was obtained from the lowest point of the flume to confirm the absence of dangerous waste contamination.

An air driven rotohammer was used to grind off surface concrete from the predetermined locations. The concrete was collected as it fell into a plastic bag which was attached to the wall below the sample site. The sample media was then transferred to vendor certified clean bottles with a cleaned spoon. A new bag was used at each sample point. The rotohammer was cleaned and rinsed with ASTM TYPE II water between each sample point.

The flume sample was taken by grinding up the surface of the flume floor in a two foot square. The ground concrete was then spooned into the sample bottles with a cleaned spoon.

The soil sample was taken from outside basin #1 six inches below the surface. The first six inches were removed with a shovel and the exposed soil was then mixed and put into vendor certified clean bottle.

All sampling equipment that came in contact with the sample was cleaned to meet SW-846 protocols for cleanliness. The samples were collected in commercially available, individually certified, pre-cleaned bottles.

000002

ANALYSES REQUESTED

Samples were analyzed for the following as required by WAC 173-303 and WHC-EP-0063.

- Samples were radiologically characterized for gamma energy analysis (GEA), gross alpha, gross beta, uranium -234, -235, -238, technetium-99, and total uranium. Radiological characterization was performed by the BHI Environmental Analytical Laboratory (EAL).
- Samples were chemically characterized for total metals (RCRA metals and vanadium), chromium⁶, pH, cyanide, sulfide, and anions (including fluoride, chloride, NO₃, NO₂, SO₄, and PO₄). Chemical characterization, with the exception of total metals, was performed by FAST. Total metals were determined by the WHC Waste Sampling and Characterization Facility (WSCF) laboratory on samples microwave digested by FAST.

ANALYSIS	SW-846 METHOD CROSSREFERENCE	FAST PROCEDURE REFERENCE

PROJECT 183-H CONCRETE FIELD SCREEN SAMPLING

Continued From Page 3

RDE 9-15-95

S.A.F. #: SS-060 Sample Date: 8/24/95
 PROJECT TITLE: 183-H CONCRETE FIELD SCREEN SAMPLING Shipment Date: 8/25/95
 CHARGE CODE: E61772
 TYPE OF PROTOCOL: Sampling was done to RCRA protocol.
 CUSTOMER: R.C. Smith WHC 372-2537
 FIELD CONTACTS: D.8. Encke
 PERSONAL: Karl B. Hulse SML Lead Sampling Tech.
Robert R. Fox SML Sampling Techn.
Tom Brey HPT Support.
Julia Martin HPT Support.
Rex Millee (Larry) Project Lead.
Nathan H. Taylor Operator (S1H)

PURPOSE: To determine if decontamination of the concrete was successful and to verify an analytical method on the soil.

LOCATION: 183-H Basins 1 and 4

REFERENCE DOCUMENTS: Sampling and Analysis Plan 012510.

SAMPLE POINT: Basin #1 East Wall quad. 118 four feet up (sample # S5060-01), Basin #1 South Wall quad. 24 five feet up (sample #S5060-02), Basin #4 quad. 45 three feet down (sample #S5060-03), Basin #4 quad. 14 three feet down (sample #S5060-04), Basin #1 flume (sample #S5060-05), Soil sample taken along the outside of Basin #1 East wall (sample # S5060-06).

SAMPLING METHOD: An air driven rotorhammer was used to grin off surface concrete from predetermined locations in Basin #1 and Basin #4. The concrete was collected as it fell into a plastic bag which was attached to the wall below the sample site. The sample media was then transferred to vender certified clean bottles with an EII 5.5 cleaned spoon. A new bag was used at each sample point. The rotorhammer was cleaned to EII 5.4 and rinsed with ASTM TYPE II water between each sample point.

The flume sample was taken by grinding up the surface of the flume floor in a two foot square. The ground concrete was then spooned into the sample bottles with an EII 5.5 cleaned spoon.

The soil sample was take from outside basin #1 east wall six inches below the surface. The first 6 inches of soil were removed with a shovel. The exposed soil was then mixed with an EII 5.5 cleaned spoon. The vender certified clean bottles were then filled using the cleaned spoon.

PPE: For the soil sample personal protective equipment included Safety Glasses, Safety Shoes, Surgeons Gloves and Blue Coveralls. Sampling in the basins were done under RWP PS-397 which required one set of anti-contamination coveralls, a hood, canvas booties, shoe covers, and two pair of gloves.

WEATHER CONDITIONS: Sunny 50°F slight breeze 2 to 3 mph.

PROJECT 183-H Concrete Field Screen Sampling

Notebook No. INHC-N-205 #47
Continued From Page 5

Shipping Information:

Samples going to 222-S Lab were shipped in COC # 009506 in cooler SML-595 in a Government vehicle on 8/25/95

Samples going to EAL were shipped in a Government vehicle in cooler SML-595, on COC # 009507 on 8/25/95

Samples going to FAST were shipped in a Government vehicle in cooler SML-595 on COC # 009505 on 8/25/95

The Total Activity 20ml bottles all went to 222-S Lab

The 125 ml poly for Metals were all shipped to FAST

The 125 ml poly for GEA, Gross Alpha/Beta, U, Tc-99 were all shipped to EAL

183H Concrete Data Validation Summary

The data package was validated at level C as required by WHC-SD-EN-SPP-002. Parameters validated include RCRA metals, cyanide, sulfide, hexavalent chromium, pH, and anions.

Rejected Data (UR)

- Cyanide results were rejected due to low matrix spike recoveries (<30%). However, if a correction for spike recovery is applied, the worst case results would be significantly lower than the 250 mg/kg threshold for releasable cyanide.
- Lead and Selenium were rejected due to low matrix spike recoveries. However, if a correction for the spike recovery is applied, the worst case results would be significantly lower than the 100 mg/kg threshold for TCLP metals (total).

Estimated Data (J/UJ)

- Arsenic and nitrite were qualified estimated for no matrix spike. Barium and Chromium were qualified estimated for high matrix spike recoveries. Mercury was qualified as estimated due to a low matrix spike recovery (<75%).

All method blanks and duplicates were acceptable.

PHASE I SAMPLING REPORT FOR SEPTEMBER 1995

Appendix B includes the Westinghouse Hanford Company letter report for samples collected in September 1995. The "Sampling and Analysis" portion of the case narrative discusses the combined August and September sampling events. The remainder of the report addresses only the September samples. Results of samples delivered to the Environmental Restoration Contractor's Environmental Analytical Laboratory are not part of the letter report.

Project Sampling and Analysis Case Narrative

INTRODUCTION

On September 14, 1995, Sampling and Mobile Labs (SML) sampled material from the 183-H Basins 2 and 3 to determine if decontamination of the concrete was successful. Samples were delivered to the Field Assessment Services Team (FAST) as well as the Environmental Analytical Laboratory (EAL)

SAMPLING AND ANALYSIS

Authoritative and random sampling, followed by onsite analysis, was used to confirm decontamination of the 183-H basin surfaces. An authoritative sample was taken to be used to verify the basins never leaked/overflowed into the flume at the south end of the basin. Seven concrete chip samples and one soil sample were obtained for characterization. One sample was authoritatively selected from each basin, based on the previous sampling/analytical results (DOE/RL-95-27) and one sample was randomly selected from each basin, based on the numbered grid of the basins. In addition, one concrete sample was obtained from the lowest point of the flume to confirm the absence of dangerous waste contamination.

An air driven rotohammer was used to grind off surface concrete from the predetermined locations in Basins #2 and #3. The concrete was collected as it fell into a plastic bag which was attached to the wall below the sample site. The sample media was then transferred to venter certified clean bottles with a cleaned spoon. A new bag was used at each sample point. The rotohammer was cleaned and rinsed with ASTM TYPE II water between each sample point.

All sampling equipment that came in contact with the sample was cleaned to meet SW-846 protocols for cleanliness. The samples were collected in commercially available, individually certified, pre-cleaned bottles.

000002

ANALYSES REQUESTED

Samples were analyzed for the following as required by WAC 173-303 and WHC-EP-0063.

- Samples were radiologically characterized for gamma energy analysis (GEA), gross alpha, gross beta, uranium -234, -235, -238, technetium-99, and total uranium. Radiological characterization was performed by the BHI Environmental Analytical Laboratory (EAL).
- Samples were chemically characterized for total metals (RCRA metals and vanadium), chromium⁶⁺, pH, cyanide, sulfide, and anions (including fluorine, chlorine, NO₃, NO₂, SO₄, and PO₄). Chemical characterization, with the exception of total metals, was performed by FAST. Total metals were determined by the WHC Field Assessment Services Team (FAST) laboratory.

ANALYSIS	SW-846 METHOD CROSSREFERENCE	FAST PROCEDURE REFERENCE

S.A.F.#: S5-060

Sample Date: 9/14/95

PROJECT TITLE: 183-H CONCRETE FIELD SCREEN SAMPLING

Shipment Date: 9/15/95

CHARGE CODE: E61772

TYPE OF PROTOCOL: Sampling was done to RCRA protocol.

CUSTOMER: Don Smith (FSAT) WHC 372-2482

FIELD CONTACTS: D.B. Encke BIH

PERSONAL: Karl B. Hulse SML Lead Sampling Tech.

Kenneth J. Young SML Scientist

Tom E. Brey HPT Support.

Nathon H. Taylor Operator (BIH)

PURPOSE: To determine if decontamination of the concrete was successful. on the soil.

LOCATION: 183-H Basins 2 and 3

REFERENCE DOCUMENTS: Sampling and Analysis Plan 018510.

SAMPLE POINT: Basin #2 South Wall quad. 23 one foot down (sample # S5060-07), Basin #3 South Wall 16 feet from east wall and two feet up (sample #S5060-08).

SAMPLING METHOD: An air driven roto-hammer was used to grin off surface concrete from pre-determined locations in Basin #2 and Basin #3. The concrete was collected as it fell into a plastic bag which was attached to the wall below the sample site. The sample media was then transferred to vender certified clean bottles with an EII 5.5 cleaned spoon. A new bag was used at each sample point. The roto-hammer was cleaned to EII 5.4 and rinsed with ASTM TYPE II water between each sample point.

PPE: Sampling in the basins was done under RWP PS-397 which required one set of anti-contamination coveralls, a hood, canvas booties, shoe covers, and two pair of gloves.

WEATHER CONDITIONS: At 0935 Sunny, 69°F no wind.

7/15/88 9-18-95

183H Concrete Data Validation Summary

This data package was validated at level C as specified in WHC-SD-EN-SPP-002. Parameters validated include RCRA metals and mercury. All other parameters were validated with the original sample group (samples 1-6).

Estimated Data (J/UJ)

Cadmium and mercury were qualified as estimated for a high recovery in the Laboratory Control Standard (LCS), NIST 2710. Barium and chromium were qualified as estimated (J) for low LCS recoveries. All matrix spike, duplicate, and calibration standards were within limits. All method blanks were acceptable.

Project Sampling and Analysis Case Narrative

INTRODUCTION

Personnel from Sampling and Mobile Labs (SML) obtained samples from the 183-H Basin on October 23, 1995 and again on November 1, 1995. Aliquots of the samples were delivered to Environmental Analytical Laboratory (EAL) for radiological analysis and Field Assessment Services Team (FAST) for chemical analysis. An aliquot was also delivered off-site for chemical and radiological analysis

SAMPLING AND ANALYSIS

An air driven roto-hammer was used to grind off surface concrete from pre-determined locations in basins one through four to determine if decontamination of the concrete was successful. The concrete was gathered to the side with surgical gloves until sufficient volume was collected. The sample media was then transferred to vendor certified clean containers with an EII 5.5 cleaned stainless steel spoon. The roto-hammer was cleaned to EII 5.4 and rinsed with ASTM TYPE II water between each sample point. A duplicate and a split were taken from basin #4 as the same location and time as BOGRK8. Before using the roto-hammer silica sand was poured over the head and then collected as an equipment blank.

Basins #4 and #1 has water standing over a sample point in each basin. Basin #4 was pumped on October, 23, 1995 and sampled the same day. The sample point was still moist at the time of sampling. Basin #1 was sampled on November 1, 1995 after the water had been pumped out.

SAMPLE POINTS

Basin #1

Sample BOGRK1 located 15' south of the Floc basin (upper level) and 5' from the east wall.
Sample BOGRK2 located 50' south of the Floc basin and 20' in from the east wall.

Basin #2

Sample BOGRK3 located 15' south of the north Floc basin wall and 3' in from the east wall.
Sample BOGRK4 located 33' south of the Floc basin and at the base of the west wall.

Basin #3

Sample BOGRK5 located 3' south of the Floc basin and 25' in from the east wall.
Sample BOGRK6 located 40' north of the south wall and 10' in from the west wall.

Basin #4

Sample BOGRK7 located 13' south of the Floc basin and 30' in from the west wall.
Sample BOGRK8 located 40' south of the Floc basin and 20' in from the west wall.

PROJECT

183-H Basin D+D

Notebook No. WHC-N-205-47 17

Continued From Page NONE

XBH 11-21-95

S.A.F.#: B96-026
PROJECT TITLE: 183-H Basin D&D
CHARGE CODE: PV5AA
TYPE OF PROTOCOL: Sampling was done to RCRA protocol.
CUSTOMER: Don Smith (FAST) WHC 372-2482
FIELD CONTACTS: D.B. Encke BIH
PERSONAL: Karl B. Huise SML Lead Sampling Tech.
Kenneth C. Young SML Scientist
Robert R. Fox SML Sampler
operators D&D (BIH) Operations
HPT (BIH) HPT Group

Sample Date: 10/23/95 & 11/1/95
Shipment Date: 10/25/95 & 11/3/95

PURPOSE: To determine if decontamination of the concrete was successful.

LOCATION: 183-H Basins 1 through 4 the floor.

REFERENCE DOCUMENTS: Sampling and Analysis Plan 018510. And prior sampling in Logbook WHC-N-205#47 page 3.

SAMPLE POINT: Basin #1; Sample BOGRK1 located 15' south of the Floc Basin (upper level) and 5' from the East Wall. Sample BOGRK2 located 50' south of the Floc Basin and 20' in from the East wall.

Basin #2; Sample BOGRK3 15' South of the north Floc Basin wall and 3' in from east wall. (This sample is on the "upper level" of basin #2). Sample BOGRK4 located 33' south of the Floc Basin and at the base of the West wall.

Basin #3; Sample BOGRK5 located 3' south of the Floc Basin and 25' in from the east wall. Sample BOGRK6 located 40' North of the South wall and 10' in from the West wall.

Basin #4; Sample BOGRK7 located 13' South of the Floc Basin and 30' in from the West Wall. Sample BOGRK8 located 40' South of the Floc Basin and 20' in from the West Wall.

QA Samples; Equipment Blank Sample BOGRK0 taken with silica sand. Duplicate Sample BOGRK9 and Split sample BOGRK0 were taken at sample BOGRK8.

SAMPLING METHOD: An air driven roto-hammer (squirrel gun) was used to grin off surface concrete from pre-determined locations on the Basins floor. The concrete was gathered to the side with surgical gloves until sufficient volume was collected. The sample media was then transferred to vender certified clean bottles with an EII 5.5 cleaned stainless spoon. The roto-hammer was cleaned to EII 5.4 and rinsed with ASTM TYPE II water between each sample point. A duplicate and a split were taken from basin #4 at the same location and time as sample BOGRK8. Before using the squirrel gun silica sand was poured over the head and the collected as a equipment blank.

PPE: Sampling in the basins was done under RWP PS-397 which required one set of anti-contamination coveralls, a hood, canvas booties, shoe covers, and two pair of gloves.

WEATHER CONDITIONS: 10-23-95 Cloudy, light and variable winds, high 54° F, 11-1-95 Clear, light and variable winds, high 48° F

COMMENTS: Basin #4 and #1 had water standing over a sample point in each basin. Basin #4 was pumped on 10-23-95 and sampled the same day. The sample point was still moist at the time of sampling. Basin #1 was sampled on 11-1-95 after the water had been pumped out.

APPENDIX D

PERSONAL COMMUNICATION

[Faint, illegible handwritten or stamped text]

This appendix contains communication regarding 183-H concrete sampling reports by Westinghouse Hanford Company. Answers correct and/or clarify details reported in Appendices A through C of this document.

Author: William S III Callaway at -WHC121
 Date: 6/20/96 12:45 PM
 Priority: Normal
 TO: Christopher D Kramer at -WHC300
 CC: Larry L Lockrem
 CC: Donald J Smith
 CC: Melanie L Myers
 CC: William S III Callaway
 Subject: Questions re 183-H Sample Analysis reporting
 ----- Message Contents -----

C. D. Kramer

June 20, 1996
 MESSAGE INTENTIONALLY LEFT BLANK
 I believe you may have received some somewhat confused responses to some of your questions regarding work done by SAS in support of the 183-H project. The following are accurate responses:

- ** The Cr-VI analyses were done by a 1,5-diphenylcarbohydrazide based colorimetric technique. The procedure is consistent with SW-846 7196A.
- ** The pH measurements were guided by SW-846 9045 "Soil pH". SW-846 9040 is also applicable but applies mainly to operation of pH meters.
- ** HASQAP represents the Hanford Analytical Services Quality Assurance Plan (DOE/RL-94-55).
- ** ICP-AES Metals analyses for your samples:
 S5060-01 through -06 (Collected 08/95)
 were performed at WSCF. The ICP-AES analyses for your samples:
 S5060-13 through -14 (Collected 08/95)
 and
 BOGRK0 through BOGRK9 (Collected 10/95)
 were performed at the SAS facility.
- ** Contrary to what was implied in SAS95-231, Hg was analyzed for by Cold Vapor Atomic Absorption (SW-846 7471).

I am filling in for D. J. Smith while he is out on vacation and can usually be reached at 373-5703 should you have further questions. Sorry for the confusion.

W. S. Callaway

APPENDIX E

222-S TOTAL ACTIVITY ANALYSES

This appendix contains reproductions of total activity reports issued by the Hanford Site 222-S Laboratory. All samples discussed in this report had an associated 222-S total activity analysis. Results were used in shipping and handling of samples. Results have been organized chronologically. (Readers may refer to the sample key in Section 2.0 of the main text for a complete list of sample identification numbers and associated 222-S sample numbers.)

APPENDIX F

ENVIRONMENTAL ANALYTICAL LABORATORY RADIOLOGICAL RESULTS

Results of samples delivered to the Environmental Analytical Laboratory (EAL) were reported to project personnel through two memorandums. This appendix contains information reported by the EAL.

The Environmental Analytical Laboratory (EAL) received samples S5060-01 through S5060-08 from 183-H Basin on August 28, 1995. They were assigned EAL identification numbers EAL00684-EAL00689 and EAL00818-EAL00819.

Please see attached results. If further information is needed please call Al Davis 373-9731.

AID:ksb

021849

To: D. Encke
 From: A. I. Davis *A. I. Davis*
 Subject: Sample Set S-5060 Technetium Evaluation
 Date: 4 October, 1995

Analysis was completed for beta emitters not identified with gamma emitters found in the gamma scan of the samples. The results are as follows:

Sample 5060-01:

Beta total	270	pCi/g	Alpha total	2.9	pCi/g
⁴⁰ K	<u>22</u>	pCi/g	Calculated beta component from		
Residual beta	248	pCi/g	alpha	9	pCi/g
Nat. beta	<u>9</u>	pCi/g			
Assigned ⁹⁹ Tc	239	pCi/g			

Sample 5060-02:

Beta total	27	pCi/g	Alpha total	3.3	pCi/g
⁴⁰ K	<u>23</u>	pCi/g	Calculated beta component from		
Residual beta	4	pCi/g	alpha	11	pCi/g
Nat. beta	<u>11</u>	pCi/g			
Unassigned	-7	pCi/g			

Sample 5060-03:

Beta total	33	pCi/g	Alpha total	8.8	pCi/g
⁴⁰ K	<u>31</u>	pCi/g	Calculated beta component from		
Residual beta	2	pCi/g	alpha	29	pCi/g
Nat. beta	<u>29</u>	pCi/g			
Unassigned	-27	pCi/g			

Sample 5060-04:

Beta total	9	pCi/g	Alpha total	12	pCi/g
⁴⁰ K	<u>21</u>	pCi/g	Calculated beta component from		
Residual beta	-12	pCi/g	alpha	39	pCi/g
Nat. beta	<u>39</u>	pCi/g			
Unassigned	-51	pCi/g			

021849

Sample 5060-05:

Beta total	36	pCi/g
⁴⁰ K	<u>21</u>	pCi/g
Residual beta	17	pCi/g
Nat. beta	<u>12</u>	pCi/g
Unassigned	5	pCi/g

Alpha total	3.8	pCi/g
Calculated beta component from alpha	12	pCi/g

Sample 5060-06:

Beta total	98	pCi/g
⁴⁰ K	<u>28</u>	pCi/g
Residual beta	70	pCi/g
Nat. beta	<u>62</u>	pCi/g
Unassigned	8	pCi/g

Alpha total	19	pCi/g
Calculated beta component from alpha	62	pCi/g

Sample 5060-07:

Beta total	86	pCi/g
⁴⁰ K	<u>27</u>	pCi/g
Residual beta	59	pCi/g
Nat. beta	<u>49</u>	pCi/g
Unassigned	10	pCi/g

Alpha total	15	pCi/g
Calculated beta component from alpha	49	pCi/g

Sample 5060-08:

Beta total	120	pCi/g
⁴⁰ K	<u>21</u>	pCi/g
Residual beta	99	pCi/g
Nat. beta	<u>39</u>	pCi/g
Assigned ⁹⁹ Tc	60	pCi/g

Alpha total	12	pCi/g
Calculated beta component from alpha	39	pCi/g

I used the alpha activity to calculate the expected beta activity due to the natural decay chain components with the assumption that the material had no treatment to alter the equilibrium decay chain. Only two samples had any activity sufficient to assign to ⁹⁹Tc, numbers 1 and 8. If you have any questions, please call. Thank you.

GROSS RADIONUCLIDE SCREENING SAMPLE ANALYSIS REPORT

Radiometric Laboratory
 Environmental Analytical Laboratory
 IT Hanford Co.

Customer ID:	S 5060-01	SOILS	
EAL ID:	EAL00684	Pass screen	()
		Fail screen	(X)
		Other's at 50 pCi limit	
		Pass screen	()
		Fail screen	(X)

2.7E+02 Calculated Beta Total Activity (pCi/g)
 2.9E+00 Calculated Alpha Total Activity (pCi/g)

2.7E+02 Calculated total activity pCi/g
 1.2E+01 Calculated total activity error
 1.7E+01 Calculated total activity MDA

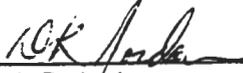

Screen sample based on (x) 99-Tc or () 90-Sr for beta activity.

The screening for other's is based on 50 pCi/g Beta and Alpha, and 2 pCi/g Alpha including the 2 sigma error.

A passed for Soils indicates that the soil sample contained less than 200 pCi/g total radioactivity of which less than 20 pCi/g is from alpha emitting radionuclides. For conservatism, a failed screen may also have one or more of the following characteristics: The sum of the total gamma activity detected in the soil is above 5 pCi/g; Beta emission from the bulk sample is found above the natural Hanford soil background (corresponding to approximately 5 pCi/g Sr-90 or 100 pCi/g Tc-99); or Alpha emission from the bulk soil is found above the natural Hanford soil background (corresponding to approximately 10 pCi/g Am-241). Naturally occurring radionuclides common to Hanford soil, tritium, and Carbon-14 are not included in the screening measurement.

Screen sample based on (x) 99-Tc or () 90-Sr for beta activity.

The screening for other's is based on 50 pCi/g Beta and Alpha, and 2 pCi/g Alpha including the 2 sigma error.

A passed for Soils indicates that the soil sample contained less than 200 pCi/g total radioactivity of which less than 20 pCi/g is from alpha emitting radionuclides. For conservatism, a failed screen may also have one or more of the following characteristics: The sum of the total gamma activity detected in the soil is above 5 pCi/g; Beta emission from the bulk sample is found above the natural Hanford soil background (corresponding to approximately 5 pCi/g Sr-90 or 100 pCi/g Tc-99); or Alpha emission from the bulk soil is found above the natural Hanford soil background (corresponding to approximately 10 pCi/g Am-241). Naturally occurring radionuclides common to Hanford soil, tritium, and Carbon-14 are not included in the screening measurement.

Gross Beta analysis	110	
Beta from decay chains (naturals)	8.7	
Residual assigned to ⁹⁹ Tc	90.3	
Gross Alpha	12.1	
Alpha Energy Analysis	11.2	No discernable peaks

The one to two gram samples for the gross alpha and beta were 10 gram splits from the original sample. The alpha sample was a 0.5 gram split from the same source used for the gross analysis. The ⁹⁰Sr activity was based on the ⁹⁰Y that is in equilibrium with the Strontium.

The determination for the beta activity from the natural decay chain was made from the AEA analysis, the alpha analysis has less interference and better sensitivity. Alpha counts were observed, but the spectrum did not display any statistically significant alpha peaks.

If there are any questions, please call Al Davis at 373-9731, thank you.

Definitions:

All errors reported at 2 standard deviations

For soils and natural samples, the following applies:

The analysis of U238 is based on the activity of Pa234m

The analysis of Np237 is based on the activity of Pa233

U238dau is the activity of Pb214 and Bi214, short lived daughter products of U238. Equilibrium between parent and daughter products probably does not exist in disturbed materials.

Th32dau is the activity of Ac228, Pb212, and Tl208, short lived daughter products of Th232. Equilibrium between parent and daughter products may not exist in disturbed materials.

Other samples, not containing natural materials, may have inapplicable results for the Th, U, transuranics and daughter products. The results must then be balanced against the gross alpha analysis.

N/R means no result or analysis not requested.

The analysis of Np237 is based on the activity of Pa233

U238dau is the activity of Pb214 and Bi214, short lived daughter products of U238. Equilibrium between parent and daughter products probably does not exist in disturbed materials.

Th32dau is the activity of Ac228, Pb212, and Tl208, short lived daughter products of Th232. Equilibrium between parent and daughter products may not exist in disturbed materials.

Other samples, not containing natural materials, may have inapplicable results for the Th, U, transuranics and daughter products. The results must then be balanced against the gross alpha analysis.

N/R means no result or analysis not requested.

GROSS RADIONUCLIDE SCREENING SAMPLE ANALYSIS REPORT

Radiometric Laboratory
Environmental Analytical Laboratory
IT Hanford Co.

Customer ID:	B0GRK6	SOILS	
EAL ID:	EAL01220	Pass screen	(X)
	Concrete Sample	Fail screen	()
		Other's at 50 pCi limit	
		Pass screen	()
		Fail screen	(X)

1.43E+02 Calculated Beta Total Activity (pCi/g)
3.68E+00 Calculated Alpha Total Activity (pCi/g)

1.47E+02 Calculated total activity pCi/g
2.69E+01 Calculated total activity error
5.09E+01 Calculated total activity MDA

Screen sample based on (x) 99-Tc or () 90-Sr for beta activity.

4.60E+00 90-Sr pCi/g sample

The screening for other's is based on 50 pCi/g Beta and Alpha, and 2 pCi/g Alpha including the 2 sigma error.

A passed for Soils indicates that the soil sample contained less than 200 pCi/g total radioactivity of which less than 20 pCi/g is from alpha emitting radionuclides. For conservatism, a failed screen may also have one or more of the following characteristics: The sum of the total gamma activity detected in the soil is above 5 pCi/g; Beta emission from the bulk sample is found above the natural Hanford soil background (corresponding to approximately 5 pCi/g Sr-90 or 100 pCi/g Tc-99); or Alpha emission from the bulk soil is found above the natural Hanford soil background (corresponding to approximately 10 pCi/g Am-241). Naturally occurring radionuclides common to Hanford soil, tritium, and Carbon-14 are not included in the screening measurement.

MEMORANDUM

TO: 183-H Basin D&D, Surface Removal Characterization Project QA Record December 15, 1995

FR: Heidi Gregerson, Golder Associates Inc. *HGG*

RE: INORGANIC DATA VALIDATION SUMMARY FOR DATA PACKAGE W0747-QES (943-1610.111 747INO.HB)

INTRODUCTION

This memo presents the results of data validation on data package W0747-QES prepared by Quanterra Environmental Services. Sample information is provided in the following table.

SAMPLE ID	COMMENTS	ANALYSIS	MEDIA
B0GNX2		INORGANICS	DRUM SOLIDS
B0GNX3			DRUM SOLIDS
B0GNX4		SEE ATTACHMENT 4	DRUM SOLIDS
B0GNX5			DRUM SOLIDS
B0GNX6			DRUM SOLIDS
B0GNX7			DRUM SOLIDS
B0GNX8			DRUM SOLIDS
B0GNY0			DRUM SOLIDS
B0GNY1			DRUM SOLIDS
B0GNY2			DRUM SOLIDS

Data validation was conducted to level C in accordance with the WHC statement of work (WHC 1994) and validation procedures (WHC 1993). Attachments 1 through 5 provide the following information as indicated below:

- Attachment 1. Glossary of Data Reporting Qualifiers
- Attachment 2. Summary of Data Qualifications
- Attachment 3. Qualified Data Summary and Annotated Laboratory Reports
- Attachment 4. Laboratory Narrative and Chain-of-Custody Documentation
- Attachment 5. Data Validation Supporting Documentation

DATA QUALITY OBJECTIVES

This section presents a summary of the data quality in terms of the referenced validation criteria.

Precision. Goals for precision were met.

Accuracy. Goals for accuracy were met, with the exception of those deficiencies listed below.

Detection Limits. Detection limit goals were met for all sample results.

Data Package ID: W0747-OES

Analysis: INORGANICS

Completeness. The data package was complete for all requested analyses. A total of ten samples were validated in this data package with a total of 220 determinations reported, 213 of which were deemed valid. This results in a completeness of 97%, which meets the 90% objective of the work plan.

MAJOR DEFICIENCIES

The following major deficiencies were identified during data validation which required qualification of data as unusable:

Spike Sample

- The percent recovery for cadmium and vanadium was less than 30% and associated samples were qualified. Attachments 2 and 5 provide a summary of samples affected, data qualifications applied and supporting documentation.

MINOR DEFICIENCIES

The following minor deficiencies were identified during data validation which required qualification of data:

Spike Sample

- The percent recovery for antimony, cadmium, lead, thallium, and vanadium was outside the control limit and associated samples were qualified. Attachments 2 and 5 provide a summary of samples affected, data qualifications applied and supporting documentation.

GLOSSARY OF DATA REPORTING QUALIFIERS

THIS PAGE INTENTIONALLY
LEFT BLANK

**THIS PAGE INTENTIONALLY
LEFT BLANK**

WHC-SD-EN-SPP-002, REV.2

Glossary of Inorganic Data Reporting Qualifiers.

- B - Indicates the constituent was analyzed for and detected. The concentration reported is less than the contract required detection limit (CRDL) but greater than the instrument detection limit (IDL). The associated data should be considered usable for decision making purposes.
- U - Indicates the constituent was analyzed for and not detected. The concentration reported is the sample detection limit corrected for aliquot size, dilution and percent solids (in the case of solid matrices) by the laboratory. The associated data should be considered usable for decision making purposes.
- UJ - Indicates the constituent was analyzed for and not detected. Due to a minor quality control deficiency identified during data validation the concentration may not accurately reflect the sample detection limit. The associated data have been qualified as estimated but should be considered usable for decision making purposes.
- BJ - Indicates the constituent was analyzed for and detected at a concentration less than the contract required detection limit (CRDL) but greater than the instrument detection limit (IDL). Due to a minor quality control deficiency identified during data validation the associated data have been qualified as estimated, but should be considered usable for decision making purposes.
- J - Indicates the constituent was analyzed for and detected. Due to a minor quality control deficiency identified during data validation the associated data have been qualified as estimated, but should be considered usable for decision making purposes.
- UR - Indicates the constituent was analyzed for and not detected. Due to a major quality control deficiency identified during data validation, the associated data have been qualified as unusable for decision making purposes.
- R - Indicates the constituent was analyzed for and detected. Due to a major quality control deficiency identified during data validation, the associated data have been qualified as unusable for decision making purposes.

CERTIFICATE OF ANALYSIS

Bechtel Hanford Incorporated
P.O. Box 1970
Richland, Washington 99352

November 14, 1995

Attention: Joan Kessner

Project number	:	550.105
Date Received by Lab	:	October 2, 1995
Number of Samples	:	Ten (10)
Sample Type	:	Solid
SDG Number	:	W0747
Data Deliverable	:	Summary

I. Introduction

On October 2, 1995, ten (10) water samples were received by Quanterra, Richland and transferred to Quanterra, St. Louis for chemical analysis. Upon receipt, the samples were given the following laboratory ID numbers to correspond with the specific client ID's:

<u>St Louis ID</u>	<u>BHI ID</u>	<u>Richland ID</u>	<u>Matrix</u>	<u>Date of Receipt</u>
9487-001	BOGNX2	51001001	Solid	10/02/95
9487-002	BOGNX3	51001002	Solid	10/02/95
9487-003	BOGNX4	51001003	Solid	10/02/95
9487-004	BOGNX5	51001004	Solid	10/02/95
9487-005	BOGNX6	51001005	Solid	10/02/95
9487-006	BOGNX7	51001006	Solid	10/02/95
9487-007	BOGNX8	51001007	Solid	10/02/95
9487-008	BOGNY0	51001008	Solid	10/02/95
9487-009	BOGNY1	51001009	Solid	10/02/95
9487-010	BOGNY2	51001010	Solid	10/02/95

II. Analytical Results/ Methodology

The analytical results for this report are presented by analytical test. Each set of data includes sample identification information, analytical results and the appropriate detection limits.

Analyses requested: ICP metals by EPA method 6010 and Arsenic, Lead, Selenium, and Thallium by Trace. Formate, Bromide, Chloride, Fluoride, Nitrate, Phosphate, and Sulfate by EPA method 300.0. Sulfide by EPA method 9030. Cyanide by EPA method 9010. PH by EPA method 9045.

III. Quality Control

A Laboratory Control Sample and Method Blank were analyzed with each preparation batch. Matrix Spike and Matrix Spike Duplicate or Sample Duplicate analyses were performed per the protocol for each analyte. Sample Duplicate analysis was performed per the protocol for the pH analysis.

IV. Definitions

The following codes are used to denote laboratory quality control samples and can be found in the data summary section of this report:

QCBLK- Quality Control Blank, Method Blank
QCLCS- Quality Control Laboratory Control Sample, Blank Spike

 Page 3

V. Comments

Percent solids was not determined for the samples in SDG W0747. Due to software configuration, the CLP forms list solid sample result units as "dry weight" and % solids as "100". The results on the forms are actually mg/Kg as is and are not corrected for percent solids. The figure of 100 was used as percent solids for calculation purposes only and does not represent measured solids content of the samples.

All the samples in SDG W0747 required dilution due to interelement interferences. The instrument software flagged the undiluted run with an error code indicating that an interferant, in this case Calcium for 9487-003 and 9487-007 and Iron for samples in the SDG except sample 9487-003, was interfering with the analysis of most of the elements requested. The samples were diluted and reanalyzed without interference errors.

The following list of elements had Matrix Spike and Matrix Spike Duplicate recoveries outside the 80% to 120% range.

	MS	MSD
Antimony	140.0	183.3
Cadmium	0	16.9
Lead	70.4	72.4
Silver	0	0
Thallium	71.6	71.5
Vanadium	0	25.3

The Relative Percent Difference for the serial dilution for Arsenic (21.1), Calcium (13.4), Copper (10.6) and Nickel was greater than 10 therefore all associated data was flagged with an "E".

Project Number: 550.105
SDG: W0747
Page 4

The Matrix Spike recovery for the Cyanide analysis on sample 9487-001 was outside of the suggested limits of 75-125%.

The Relative Percent Difference could not be calculated due to the values being below the detection limits for sample 9487-001 and it's duplicate on the Cyanide analysis.

The Matrix Spike recovery for the Formate analysis on sample 9487-001 was outside of the suggested limits of 75-125%.

In order to clarify the Formate peaks from the Fluoride peaks, the entire batch was reprinted showing only the four minutes of run and reintegrated to even out the baseline.

The Relative Percent Difference could not be calculated due to the values being below the detection limits for sample 9487-001 and it's duplicate on the Phosphate and Bromide analyses.

The Matrix Spike recovery for the Nitrate, Nitrite and Phosphate analyses on sample 9487-001 were outside of the suggested limits of 75-125% due to the spike concentration exceeding the sample concentration by a factor of four or more.

The retention times were entered into the computer program incorrectly, so it failed to identify the peaks on the calibration curve. The correct retention times were then entered correctly and the data for the calibration curve was regenerated.

Sample 9487-001, it's duplicate and 9487-010 were manually integrated for Fluoride to level the baseline.

Samples, 9487-001, -001DUP, -002, -003, -005, -006, -007, -009, and -010 were diluted for Bromide to reduce the interfering Nitrate peak on the ion chromatogram, resulting in a higher detection limit.

SDG: W0747
Page 5

Due to the sample matrix, an extra 20 ml of CaCl₂ above the suggested amount of 20 ml per the protocol was used to determine the pH using the EPA method 9045 on sample 9487-006. See NCM # SL-94-2090.

MEMORANDUM

TO: 183-H Basin D&D, Surface Removal Project QA Record December 21, 1995

FR: Heidi Gregerson, Golder Associates Inc. *HG*

RE: GENERAL CHEMISTRY DATA VALIDATION SUMMARY FOR DATA PACKAGE
W0747-QES (943-1610.111 747GEN.HB)

INTRODUCTION

This memo presents the results of data validation for the analysis indicated below on data package W0747-QES prepared by Quanterra Environmental Services. Sample information is provided in the following table.

SAMPLE ID	COMMENTS	ANALYSIS	MEDIA
B0GNX2		GENERAL CHEMISTRY SEE ATTACHMENT 4	DRUM SOLIDS
B0GNX3			DRUM SOLIDS
B0GNX4			DRUM SOLIDS
B0GNX5			DRUM SOLIDS
B0GNX6			DRUM SOLIDS
B0GNX7			DRUM SOLIDS
B0GNX8			DRUM SOLIDS
B0GNY0			DRUM SOLIDS
B0GNY1			DRUM SOLIDS
B0GNY2			DRUM SOLIDS

Data validation was conducted to level C in accordance with the WHC statement of work (WHC 1994) and validation procedures (WHC 1993). Attachments 1 through 5 provide the following information as indicated below:

- Attachment 1. Glossary of Data Reporting Qualifiers
- Attachment 2. Summary of Data Qualifications
- Attachment 3. Qualified Data Summary and Annotated Laboratory Reports
- Attachment 4. Laboratory Narrative and Chain-of-Custody Documentation
- Attachment 5. Data Validation Supporting Documentation

DATA QUALITY OBJECTIVES

This section presents a summary of the data quality in terms of the referenced validation criteria.

Precision. Goals for precision were met.

Accuracy. Goals for accuracy were met.

Completeness. The data package was complete for all requested analyses. A total of ten samples were validated in this data package with a total of 110 determinations reported, 101 of which were

Data Package ID: W0747-QES

Analysis: GENERAL CHEMISTRY

deemed valid. This results in a completeness of 92 percent, which meets the 90% objective of the work plan.

Detection Limits. Detection limit goals were met for all the sample results.

MAJOR DEFICIENCIES

The following major deficiencies were identified during data validation which required qualification of data as unusable:

Holding Times

- The holding time for ortho-phosphate was exceeded for all samples by greater than twice the limit and associated samples were qualified accordingly. Attachments 2 and 5 provide a summary of data qualifications applied and supporting documentation.

MINOR DEFICIENCIES

The following minor deficiencies were identified during data validation which required qualification of data:

Holding Times

- The holding time for pH, nitrate, nitrite, and ortho-phosphate was exceeded by greater than twice the limit. Attachments 2 and 5 provide a summary of data qualifications applied and supporting documentation.

WHC-SD-EN-SPP-002, REV.2

Glossary of Inorganic Data Reporting Qualifiers.

- B - Indicates the constituent was analyzed for and detected. The concentration reported is less than the contract required detection limit (CRDL) but greater than the instrument detection limit (IDL). The associated data should be considered usable for decision making purposes.
- U - Indicates the constituent was analyzed for and not detected. The concentration reported is the sample detection limit corrected for aliquot size, dilution and percent solids (in the case of solid matrices) by the laboratory. The associated data should be considered usable for decision making purposes.
- UJ - Indicates the constituent was analyzed for and not detected. Due to a minor quality control deficiency identified during data validation the concentration may not accurately reflect the sample detection limit. The associated data have been qualified as estimated but should be considered usable for decision making purposes.
- BJ - Indicates the constituent was analyzed for and detected at a concentration less than the contract required detection limit (CRDL) but greater than the instrument detection limit (IDL). Due to a minor quality control deficiency identified during data validation the associated data have been qualified as estimated, but should be considered usable for decision making purposes.
- J - Indicates the constituent was analyzed for and detected. Due to a minor quality control deficiency identified during data validation the associated data have been qualified as estimated, but should be considered usable for decision making purposes.
- UR - Indicates the constituent was analyzed for and not detected. Due to a major quality control deficiency identified during data validation, the associated data have been qualified as unusable for decision-making purposes.
- R - Indicates the constituent was analyzed for and detected. Due to a major quality control deficiency identified during data validation, the associated data have been qualified as unusable for decision making purposes.

CERTIFICATE OF ANALYSIS

Bechtel Hanford Incorporated
P.O. Box 1970
Richland, Washington 99352

November 14, 1995

Attention: Joan Kessner

Project number:	:	550.105
Date Received by Lab	:	October 2, 1995
Number of Samples	:	Ten (10)
Sample Type	:	Solid
SDG Number	:	W0747
Data Deliverable	:	Summary

I. Introduction

On October 2, 1995, ten (10) water samples were received by Quanterra, Richland and transferred to Quanterra, St. Louis for chemical analysis. Upon receipt, the samples were given the following laboratory ID numbers to correspond with the specific client ID's:

<u>St. Louis ID</u>	<u>BHI ID</u>	<u>Richland ID</u>	<u>Matrix</u>	<u>Date of Receipt</u>
9487-001	BOGNX2	51001001	Solid	10/02/95
9487-002	BOGNX3	51001002	Solid	10/02/95
9487-003	BOGNX4	51001003	Solid	10/02/95
9487-004	BOGNX5	51001004	Solid	10/02/95
9487-005	BOGNX6	51001005	Solid	10/02/95
9487-006	BOGNX7	51001006	Solid	10/02/95
9487-007	BOGNX8	51001007	Solid	10/02/95
9487-008	BOGNY0	51001008	Solid	10/02/95
9487-009	BOGNY1	51001009	Solid	10/02/95
9487-010	BOGNY2	51001010	Solid	10/02/95

Page 2

II. Analytical Results/ Methodology

The analytical results for this report are presented by analytical test. Each set of data includes sample identification information, analytical results and the appropriate detection limits.

Analyses requested: ICP metals by EPA method 6010 and Arsenic, Lead, Selenium, and Thallium by Trace. Formate, Bromide, Chloride, Fluoride, Nitrate, Phosphate, and Sulfate by EPA method 300.0. Sulfide by EPA method 9030. Cyanide by EPA method 9010. PH by EPA method 9045.

III. Quality Control

A Laboratory Control Sample and Method Blank were analyzed with each preparation batch. Matrix Spike and Matrix Spike Duplicate or Sample Duplicate analyses were performed per the protocol for each analyte. Sample Duplicate analysis was performed per the protocol for the pH analysis.

IV. Definitions

The following codes are used to denote laboratory quality control samples and can be found in the data summary section of this report:

QCBLK- Quality Control Blank, Method Blank
QCLCS- Quality Control Laboratory Control Sample, Blank Spike

 Page 3

V. Comments

Percent solids was not determined for the samples in SDG W0747. Due to software configuration, the CLP forms list solid sample result units as "dry weight" and % solids as "100". The results on the forms are actually mg/Kg as is and are not corrected for percent solids. The figure of 100 was used as percent solids for calculation purposes only and does not represent measured solids content of the samples.

All the samples in SDG W0747 required dilution due to interelement interferences. The instrument software flagged the undiluted run with an error code indicating that an interferant, in this case Calcium for 9487-003 and 9487-007 and Iron for samples in the SDG except sample 9487-003, was interfering with the analysis of most of the elements requested. The samples were diluted and reanalyzed without interference errors.

The following list of elements had Matrix Spike and Matrix Spike Duplicate recoveries outside the 80% to 120% range.

	MS	MSD
Antimony	140.0	183.3
Cadmium	0	16.9
Lead	70.4	72.4
Silver	0	0
Thallium	71.6	71.5
Vanadium	0	25.3

The Relative Percent Difference for the serial dilution for Arsenic (21.1), Calcium (13.4), Copper (10.6) and Nickel was greater than 10 therefore all associated data was flagged with an "E".

Project Number: 550.105
SDG: W0747
Page 4

The Matrix Spike recovery for the Cyanide analysis on sample 9487-001 was outside of the suggested limits of 75-125%.

The Relative Percent Difference could not be calculated due to the values being below the detection limits for sample 9487-001 and its duplicate on the Cyanide analysis.

The Matrix Spike recovery for the Formate analysis on sample 9487-001 was outside of the suggested limits of 75-125%.

In order to clarify the Formate peaks from the Fluoride peaks, the entire batch was reprinted showing only the four minutes of run and reintegrated to even out the baseline.

The Relative Percent Difference could not be calculated due to the values being below the detection limits for sample 9487-001 and its duplicate on the Phosphate and Bromide analyses.

The Matrix Spike recovery for the Nitrate, Nitrite and Phosphate analyses on sample 9487-001 were outside of the suggested limits of 75-125% due to the spike concentration exceeding the sample concentration by a factor of four or more.

The retention times were entered into the computer program incorrectly, so it failed to identify the peaks on the calibration curve. The correct retention times were then entered correctly and the data for the calibration curve was regenerated.

Sample 9487-001, its duplicate and 9487-010 were manually integrated for Fluoride to level the baseline.

Samples, 9487-001, -001DUP, -002, -003, -005, -006, -007, -009, and -010 were diluted for Bromide to reduce the interfering Nitrate peak on the ion chromatogram, resulting in a higher detection limit.

SDG: W0747
Page 5

Due to the sample matrix, an extra 20 ml of CaCl_2 above the suggested amount of 20 ml per the protocol was used to determine the pH using the EPA method 9045 on sample 9487-006. See NCM # SL-94-2090.

MEMORANDUM

TO: 183-H Basin D&D, Surface Removal Characterization Project QA Record December 21, 1995

FR: Heidi Gregerson, Golder Associates Inc. *HGG*

RE: TCLP METALS DATA VALIDATION SUMMARY FOR DATA PACKAGE W0747-QES (943-1610.111 747TCLP.HB)

INTRODUCTION

This memo presents the results of data validation for the analysis specified below on data package W0747-QES prepared by Quanterra Environmental Services. Sample information is provided in the following table.

SAMPLE ID	COMMENTS	ANALYSIS	MEDIA
B0GNX7		TCLP METALS	DRUM SOLIDS
B0GNY0			DRUM SOLIDS
B0GNY2		SEE ATTACHMENT 4	DRUM SOLIDS
B0GNY4			DRUM SOLIDS

Data validation was conducted to level C in accordance with the WHC statement of work (WHC 1994) and validation procedures (WHC 1993). Attachments 1 through 5 provide the following information as indicated below:

- Attachment 1. Glossary of Data Reporting Qualifiers
- Attachment 2. Summary of Data Qualifications
- Attachment 3. Qualified Data Summary and Annotated Laboratory Reports
- Attachment 4. Laboratory Narrative and Chain-of-Custody Documentation
- Attachment 5. Data Validation Supporting Documentation

DATA QUALITY OBJECTIVES

This section presents a summary of the data quality in terms of the referenced validation criteria.

Precision. Goals for precision were met.

Accuracy. Goals for accuracy were met.

Detection Limits. Detection limit goals were met for all sample results.

Data Package ID: W0747-OES

Analysis: TCLP Metals

Completeness. The data package was complete for all requested analyses. A total of four samples were validated in this data package with a total of 32 determinations reported, all of which were deemed valid. This results in a completeness of 100%, which meets the 90% objective of the work plan.

MAJOR DEFICIENCIES

No major deficiencies were identified during data validation which required qualification of data as unusable.

MINOR DEFICIENCIES

The following minor deficiencies were identified during data validation which required qualification of data:

Holding Times

- The holding time for mercury was exceeded and associated samples were qualified. Attachments 2 and 5 provide a summary of samples affected, data qualifications applied and supporting documentation.

Blank Samples

- Arsenic and mercury were detected in the ICB and associated samples were qualified. Attachments 2 and 5 provide a summary of samples affected, data qualifications applied and supporting documentation.

GLOSSARY OF DATA REPORTING QUALIFIERS

003

**THIS PAGE INTENTIONALLY
LEFT BLANK**

WHC-SD-EN-SPP-002, REV.2

Glossary of Inorganic Data Reporting Qualifiers.

- B - Indicates the constituent was analyzed for and detected. The concentration reported is less than the contract required detection limit (CRDL) but greater than the instrument detection limit (IDL). The associated data should be considered usable for decision making purposes.
- U - Indicates the constituent was analyzed for and not detected. The concentration reported is the sample detection limit corrected for aliquot size, dilution and percent solids (in the case of solid matrices) by the laboratory. The associated data should be considered usable for decision making purposes.
- UJ - Indicates the constituent was analyzed for and not detected. Due to a minor quality control deficiency identified during data validation the concentration may not accurately reflect the sample detection limit. The associated data have been qualified as estimated but should be considered usable for decision making purposes.
- BJ - Indicates the constituent was analyzed for and detected at a concentration less than the contract required detection limit (CRDL) but greater than the instrument detection limit (IDL). Due to a minor quality control deficiency identified during data validation the associated data have been qualified as estimated, but should be considered usable for decision making purposes.
- J - Indicates the constituent was analyzed for and detected. Due to a minor quality control deficiency identified during data validation the associated data have been qualified as estimated, but should be considered usable for decision making purposes.
- UR - Indicates the constituent was analyzed for and not detected. Due to a major quality control deficiency identified during data validation, the associated data have been qualified as unusable for decision making purposes.
- R - Indicates the constituent was analyzed for and detected. Due to a major quality control deficiency identified during data validation, the associated data have been qualified as unusable for decision making purposes.

CERTIFICATE OF ANALYSIS

Bechtel Hanford Incorporated
P.O. Box 1970
Richland, Washington 99352

November 16, 1995

Attention: Joan Kessner

Project number	:	550.105
Date Received by Lab	:	October 2 and 3, 1995
Number of Samples	:	Four (4)
Sample Type	:	Solid
SDG Number	:	W0790
Data Deliverable	:	Summary

I. Introduction

On October 31, 1995, additional analyses were requested on four (4) solid samples that were originally reported in two separate SDG's. The samples were identified with the following laboratory ID numbers corresponding to their specific client ID's:

<u>St Louis ID</u>	<u>BHI ID</u>	<u>Richland ID</u>	<u>Matrix</u>	<u>Date of Receipt</u>	<u>Original SDG</u>
9487-006	B0GNX7	51001006	Solid	10/02/95	W0747
9487-007	B0GNY0	51001008	Solid	10/02/95	W0747
9487-010	B0GNY2	51001010	Solid	10/02/95	W0747
9491-003	B0GNY4	51003403	Solid	10/03/95	W0751

This report contains only the data for the additional analyses.

II. Analytical Results/ Methodology

The analytical results for this report are presented by analytical test. Each set of data includes sample identification information, analytical results and the appropriate detection limits.

ARC 12/21/95

Bechtel Hanford Incorporated
November 16, 1995
Project Number: 550.105
SDG: W0790
Page 2

Analyses requested: ICP metals by EPA method 6010 and Mercury by EPA method 7470 after TCLP extraction by EPA method 1311.

III. Quality Control

A Laboratory Control Sample and Method Blank were analyzed with each preparation batch.

IV. Definitions

The following codes are used to denote laboratory quality control samples and can be found in the data summary section of this report:

QCBLK- Quality Control Blank, Method Blank

QCLCS- Quality Control Laboratory Control Sample, Blank Spike

V. Comments

Samples 9487-006, 9487-008, 9487-010 and 9491-003 required dilution due to interelement interferences. An interferant, in this case Calcium and Iron for samples 9487-006 and 9487-008 and Calcium only for 9487-010 and 9491-003, was interfering with the analysis of all the elements requested. The samples were diluted and reanalyzed without interference errors.

The TCLP protocol requires samples to be spiked before preservation. The Matrix Spike and Matrix Spike Duplicate for Mercury was prepped on a post preservation sample. See NCM # 94-SL-2116.

1. DATA PACKAGE COMPLETENESS AND CASE NARRATIVE

Is technical verification documentation present? Yes No N/A

Is a case narrative present? Yes No N/A

Comments: _____

2. HOLDING TIMES

Are sample holding times acceptable? Yes No N/A

Comments: _____

to the holding time for Hg was exceeded and associated samples were qualified. See supporting documents.

INORGANIC ANALYSIS DATA VALIDATION CHECKLIST

3. INSTRUMENT PERFORMANCE AND CALIBRATIONS

- Were initial calibrations performed on all instruments? Yes No N/A
- Are initial calibrations acceptable? Yes No N/A
- Are ICP interference checks acceptable? Yes No N/A
- Were ICV and CCV checks performed on all instruments? Yes No N/A
- Are ICV and CCV checks acceptable? Yes No N/A

Comments: _____

4. BLANKS

- Were ICB and CCB checks performed for all applicable analyses? Yes No N/A
- Are ICB and CCB results acceptable? Yes No N/A
- Were preparation blanks analyzed? Yes No N/A
- Are preparation blank results acceptable? Yes No N/A
- Were field/trip blanks analyzed? Yes No N/A
- Are field/trip blank results acceptable? Yes No N/A

Comments: _____
1. As no Pb or Hg were detected in the ICBs
and associated samples were qualified.
See supporting documents.

5. ACCURACY

- Were spike samples analyzed? Yes No N/A
- Are spike sample recoveries acceptable? Yes No N/A
- Were laboratory control samples (LCS) analyzed? Yes No N/A
- Are LCS recoveries acceptable? Yes No N/A

Comments: _____

INORGANIC ANALYSIS DATA VALIDATION CHECKLIST

6. PRECISION

- Were laboratory duplicates analyzed? Yes No N/A
- Are laboratory duplicate samples RPD values acceptable? Yes No N/A
- Were ICP serial dilution samples analyzed? Yes No N/A
- Are ICP serial dilution %D values acceptable? Yes No N/A
- Are field duplicate RPD values acceptable? Yes No N/A
- Are field split RPD values acceptable? Yes No N/A

Comments: _____

7. FURNACE AA QUALITY CONTROL

- Were duplicate injections performed as required? Yes No N/A
- Are duplicate injection %RSD values acceptable? Yes No N/A
- Were analytical spikes performed as required? Yes No N/A
- Are analytical spike recoveries acceptable? Yes No N/A
- Was MSA performed as required? Yes No N/A
- Are MSA results acceptable? Yes No N/A

Comments: _____

8. REPORTED RESULTS AND DETECTION LIMITS

- Are results reported for all requested analyses? Yes No N/A
- Are all results supported in the raw data? Yes No N/A
- Are results calculated properly? Yes No N/A
- Do results meet the CRDLs? Yes No N/A

Comments: _____

MEMORANDUM

TO: 183-H Basin D&D, Surface Removal Characterization Project QA Record December 21, 1995

FR: Heidi Gregerson, Golder Associates Inc. *HGG*

RE: RADIOCHEMISTRY DATA VALIDATION SUMMARY FOR DATA PACKAGE
W0747-QES (943-1610.111 747RAD.HB)

INTRODUCTION

This memo presents the results of data validation for the analysis specified below on data package W0747-QES prepared by Quanterra Environmental Services. Sample information is provided in the following table.

SAMPLE ID	COMMENTS	ANALYSIS	MEDIA
B0GNX2		RADIOCHEMISTRY	DRUM SOLID
B0GNX3			DRUM SOLID
B0GNX4		SEE ATTACHMENT 4	DRUM SOLID
B0GNX5			DRUM SOLID
B0GNX6			DRUM SOLID
B0GNX7			DRUM SOLID
B0GNX8			DRUM SOLID
B0GNY0			DRUM SOLID
B0GNY1			DRUM SOLID
B0GNY2			DRUM SOLID

Data validation was conducted to level C in accordance with the WHC statement of work (WHC 1994) and validation procedures (WHC 1993). Attachments 1 through 5 provide the following information as indicated below:

- Attachment 1. Glossary of Data Reporting Qualifiers
- Attachment 2. Summary of Data Qualifications
- Attachment 3. Qualified Data Summary and Annotated Laboratory Reports
- Attachment 4. Laboratory Narrative and Chain-of-Custody Documentation
- Attachment 5. Data Validation Supporting Documentation

DATA QUALITY OBJECTIVES

This section presents a summary of the data quality in terms of the referenced validation criteria.

Precision. Goals for precision were met, with the exception of those deficiencies listed below.

Data Package ID: W0747-OES

Analysis: RADIOCHEMISTRY

Accuracy. Goals for accuracy were met, with the exception of those deficiencies listed below.

Detection Limits. Detection limit goals were met for all sample results.

Completeness. The data package was complete for all requested analyses. A total of ten samples were validated in this data package with a total of 212 determinations reported, 202 of which were deemed valid. This results in a completeness of 95 percent, which meets the 90 percent objective of the work plan.

MAJOR DEFICIENCIES

The following major deficiencies were identified during data validation which required qualification of data as unusable:

Laboratory Control Sample

- The LCS percent recovery for uranium 235 (alpha spectroscopy) was outside the control limit and associated samples were qualified. Attachments 2 and 5 provide a summary of samples affected, data qualifications applied and supporting documentation.

MINOR DEFICIENCIES

The following minor deficiencies were identified during data validation which required qualification of data:

Laboratory Control Sample

- The LCS percent recovery for uranium 238DLP was outside the control limit and associated samples were qualified. Attachments 2 and 5 provide a summary of samples affected, data qualifications applied and supporting documentation.

DATA REPORTING

- Reported sample results which are less than the minimum detectable activity (MDA) have been qualified as undetected (U) on the laboratory results form (see Attachment 3).

Data Package ID: W0747-OES Analysis: RADIOCHEMISTRY

ATTACHMENT 1

GLOSSARY OF RADIOCHEMISTRY DATA REPORTING QUALIFIERS

- U - Indicates the constituent was analyzed for, but was not detected at a concentration above the minimum detectable activity (MDA). The concentration reported is the sample result corrected for sample aliquot size, dilution factors and percent solids (in the case of solid matrices) by the laboratory. The associated data should be considered usable for decision making purposes.
- UJ - Indicates the constituent was analyzed for and was not detected at a concentration above the MDA. Due to a quality control deficiency identified during data validation, the result reported may not accurately reflect the sample concentration. The associated data should be considered usable for decision making purposes.
- J - Indicates the constituent was analyzed for and detected. The concentration reported is qualified as estimated due to a quality control deficiency identified during data validation. The associated data should be considered usable for decision making purposes.
- UR - Indicates the constituent was analyzed for and not detected. The concentration reported is qualified as unusable due to a quality control deficiency identified during data validation. The associated data should be considered unusable for decision making purposes.
- R - Indicates the constituent was analyzed for and detected. The concentration reported is qualified as unusable due to a quality control deficiency identified during data validation. The associated data should be considered unusable for decision making purposes.
