COGEMA GROUP

1. Introduction

This report covers 55 gallon drums assayed by Canberra Hanford using the In Situ Object Counting System (ISOCS). All measurements were performed in accordance with the "Sampling and Analysis Plan for the 233-S Plutonium Concentration Facility" (DOE/RL-97-87 Rev. 1) and the Canberra Hanford Quality Control Plan and procedures.

Measurements were performed at 233-S from Nov 5, 2001 through Jan 8, 2002.

All measurements in this batch are 55 gallon drums. The batch includes 15 drums and one replicate measurement. All drums are above the 100 nCi/g TRU/LLW sorting criteria.

2. Technical Information

Some drums were assayed by performing four assay measurements in 90 degree increments around the drum. The remainder of the drums were assayed with the drum rotating. Results between these two techniques have been shown to be similar. The detector was centered vertically on the drum and located at a distance of 24" from the side of the drum. For measurements where the drum was assayed in four 90 degree increments, the spectra from the four measurements were summed to provide a single spectrum that provides an average response for the drum.

The ISOCS efficiency calibration was created based on the assumption that the drum was full and had an average density based on the net weight of the drum (waste matrix only) divided by the drum volume (208 liters). Matrix material types were varied somewhat to improve the correlation of results between the low energy and high energy Pu-239 gamma lines.

Final results are calculated using the Analysis V3b spreadsheet. The Analysis V3b spreadsheet includes both a Pu mass with the 3 sigma TMU included and a Pu mass with the 3 sigma measurement uncertainty included.

It should be noted that in all measurements performed as a part of this batch, the actual total measurement uncertainty should be significantly lower than the reported value since the uncertainty calculation for the Am-241 is based on the 59.5 keV gamma, and these drum assays all have good results for the higher energy Am-241 gammas.

During the period of these measurements, the software on the ISOCS system was reloaded from a system backup. The backup contained an earlier energy calibration. This does not cause a problem in the assay measurements and is discussed in a memo included on pages 5 through 8 of this report.

3. Quality Control Results

Daily background and QC check source measurements are performed on the system. Charts for these measurements are on pages 9 - 14 of this report. The control charts cover the period from Oct 28, 2001 – Jan 8, 2002. All measurements for this period are in control.

A replicate count was performed on drum number 233S-01-0043. The original and replicate results agree within acceptable limits as shown below for the key measurement nuclide Pu-239.

Replicate Analysis	
Pu-239(orig) - Pu-239(rep)	21.1
1.96 * Sqrt(unc(orig)^2+unc(rep)^2)	329.9

4. Summary of Results

Full data packages for each drum are included as an attachment beginning on page 15. The following data is a summary of the total TRU activity results and plutonium gram values for each assay. The Pu Mass plus 3 sigma values in the table are based on counting statistics. Pu Mass plus 3 sigma TMU values are reported on the final spreadsheets included in the data packages.

Drum ID	Drum Net Weight (kg)	TRU Act nCi/g		TMU Uncert (nCi/g)	Pu Mass (g)	Pu Mass(g) + 3 sigma
233S-01-0043	67.9	5.03E+3	+/-	2.40E+3	1.92E+0	2.38E+0

Software Reload Memo

From: Michael G. Cantaloub
To: Bruce Gillespie
Date: 1/25/02

SUBJ: SOFTWARE RELOAD

The energy calibration used for Inspector/Detector combination 7219 was initially performed on 2/27/01. On 11/29/01, as part of routine maintenance, a new energy calibration was performed and applied to the detector. On 1/7/02, the software on the laptop computer used for operating the detector had an unrecoverable fault. To rectify the situation the software was reloaded from backup files. As a consequence of the reload, the 11/19/01 energy calibration was lost and written over by the original 2/27/01 calibration. As such, there is a "window" from 11/29/01 until 1/7/02 where items where the 11/29/01 energy calibration is used. All items assayed after 1/08/02 use the 2/27/01. The difference in energy calibration is minimal.

The 2/27/01 energy calibration is of the form: Energy = 0.10490 + 0.2499·(Channel).

The 11/29/01 energy calibration is of the form: Energy = 0.02252 + 0.2500·(Channel)

The difference between the calibrations with respect to properly identifying a peak emission is negligible. The table below shows the difference between the two calibrations at select energies or channels.

Energy (keV)	Cal Date 2/27/01	Cal Date 11/29/01	Difference in Energy
60	15.0989	15.02252	0.51%
120	30.0929	30.02252	0.23%
320	80.0729	80.02252	0.06%
420	105.0629	105.0225	0.04%
660	165.0389	165.0225	0.01%

Likewise, the difference in system resolution as indicated by the peak full width at half maximum (FWHM) is minimal.

Overall, the there is nothing to suggest that the change in energy calibration due to the software reload has any impact on the final assay results.

Item Assayed	Assay Date	Energy Calibration Date
