3. Comments:

In May 2021, green stained rocks were encountered north 165KE where the railroad tracks were being removed. Samples collected from stained rocks and surrounding area identified hexavalent chromium exceeding the remedial action goal of 2.0 mg/kg. A sample taken 10 inches below this location did not identify any contaminants. Additional samples were later collected in this area at depth intervals ranging from the surface to 15 feet below surface. No hexavalent chromium exists below the original location where the green rocks were observed. Based on the sample results, it is recommended that the 100-K-133 Discovery Site be classified as Not Accepted. No further sampling will be conducted. SEE ATTACHED Summary document.
