HNF-EP-0182, Rev. 178

# Waste Tank Summary Report for Month Ending January 31, 2003

RECEIVED  
APR 04 2003

EDMC

Prepared for the U.S. Department of Energy  
Assistant Secretary for Environmental Management

**CH2MHILL**

*Hanford Group, Inc.*

Richland, Washington

Contractor for the U.S. Department of Energy  
Office of River Protection under Contract DE-AC27-99RL14047

Approved for Public Release; Further Dissemination Unlimited

**LEGAL DISCLAIMER** \_\_\_\_\_

This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government nor any agency thereof, nor any of their employees, nor any of their contractors, subcontractors or their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or any third party's use or the results of such use of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise, does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof or its contractors or subcontractors. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or any agency thereof.

This report has been reproduced from the best available copy.

<b>21. Design Check</b> Record Information on the ECN-6 Form N/A	<b>22. Design Verification Required?</b> <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No If Yes, as a minimum attach the one page checklist from TFC-ENG-DESIGN-P-17.	<b>23. Closeout / Cancel / Void</b> <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No If Yes, Record Information on the ECN-7 Form and attach form(s).
--	---	--

**24. Revisions Planned** (Include a brief description of the contents of each revision)

Document will be revised monthly in 2003

Note: All Revisions shall have the approvals of the affected organizations as identified in block 9 "Approval Designator," on page 1 of this ECN.

<b>25a. Commercial Grade Item Dedication Numbers</b> (associated with this design change)  N/A	<b>25b. Engineering Data Transmittal Numbers</b> (associated with this design change, e.g., new drawings, new documents)  N/A
--	---

<b>26a. Design Cost Estimate</b> N/A	<b>26b. Materials / Procurement Costs</b> N/A	<b>26c. Estimated Labor Hours</b> N/A
<b>27. Field Change Notice(s) Used?</b> (Used for ECN Revisions only) <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No If Yes, Record Information on the ECN-8 Form attach form(s) and identify permanent changes.		NOTE: ECN Revisions are required to record and approve all FCN's issued during the field modification work process. If the FCN's have not changed the original design media then they are just incorporated into the ECN file via an ECN revision. If the FCN did change the original design media then the ECN Revision will include the necessary engineering changes to the original design media changes.

**Design Details/Attributes (to be filled out by the change originator) identified in the ECN.**

1. Issue/Problem Statement included	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	21. Basis for Selected Alternative explained, including assumptions	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
2. Safety/Commitment/Programmatic Impacts identified – NEPA Documentation completed	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	22. Potential Component/System Impacts identified and resolved	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
3. System/Equipment/Personnel Impacts identified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	23. Potential Software Impacts identified and resolved	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
4. Technical Evaluation included	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	24. Potential Safety Impacts are identified and resolved (e.g., energized electrical equipment)	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
5. Compliance w/ Design Basis identified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	25. Modification is Constructible and can be implemented	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
6. Assumptions/Sources clearly identified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	26. Design considers Operational Impacts	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
7. Affected Documents and Databases clearly identified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	27. Contamination Controls are planned	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
8. Inputs Verified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	28. Pre-Installation/Mockup/Prototype Testing planned	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
9. Required Function(s) / changes clearly identified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	29. Sketches/Drawings for Tools/Fabricated Components included	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
10. Safety Basis/Commitments/Concerns evaluated	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	30. Hardware Design described	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
11. Application of Industry Standards/Codes explained	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	31. Software/Firmware Design described	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
12. Proper Analytical Techniques employed	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	32. Inspections (per Codes & Standards) / Quality Checks included	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
13. Interfaces evaluated and identified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	33. Dimensions and Tolerances included	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
14. Material/Component Compatibility evaluated	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	34. Sketches/Drawings for Installation included	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
15. ALARA/Radiological controls/chemical hazards evaluated	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	35. Housekeeping/Personnel Safety Requirements identified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
16. Human/Machine Interface evaluated	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	36. Walkdown(s) performed/Labeling Correct	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
17. Program impacts evaluated	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	37. Acceptance Test generated and Acceptance Criteria included	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
18. Design Basis Calculations updated	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	38. M&TE Requirements identified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
19. Alternatives described/evaluated and address resolution of problem	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	39. Training/Qualification of Test Personnel identified	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A
20. Impacts on Maintenance and OPS described	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	40. Safety and Hazards Analysis assessed	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A

WASTE TANK SUMMARY REPORT

B. M. Hanlon

ABSTRACT

*This report is the official inventory for radioactive waste stored in underground tanks in the 200 Areas at the Hanford Site. Data that depict the status of stored radioactive waste and tank vessel integrity are contained within the report. This report provides data on each of the existing 177 large underground waste storage tanks and 60 smaller miscellaneous underground storage tanks and special surveillance facilities, and supplemental information regarding tank surveillance anomalies and ongoing investigations. This report is intended to meet the requirement of U.S. Department of Energy Order 435.1 (DOE-HQ, August 28, 2001, Radioactive Waste Management, U.S. Department of Energy-Washington, D.C.) requiring the reporting of waste inventories and space utilization for the Hanford Site Tank Farm tanks.*

This page intentionally left blank.

METRIC CONVERSION CHART		
1 inch	=	2.54 centimeters
1 foot	=	30.48 centimeters
1 gallon	=	3.79 liters
1 ton	=	0.91 metric tons
$^{\circ}\text{F} = \left( \frac{9}{5} ^{\circ}\text{C} \right) + 32$		
1 Btu/h = 0.2931 watts (International Table)		

**WASTE TANK SUMMARY REPORT**  
For Month Ending January 31, 2003

**Note:** Changes from the previous month are in **bold print**.

**I. WASTE TANK STATUS**

Double-Shell Tanks (DST)	28 double-shell	10/86 - date last DST tank was completed
Single-Shell Tanks (SST)	149 single-shell	1966 - date last SST tank was completed
Assumed Leaker Tanks	67 single-shell	07/93 - date last Assumed Leaker was identified
Sound Tanks	28 double-shell 82 single-shell	1986 - date DSTs determined sound 07/93 - date last SST determined Sound
Interim Stabilized Tanks <sup>a</sup> (IS)	132 single-shell	08/02 - date last IS occurred
Not Interim Stabilized <sup>b</sup>	17 single-shell	Tanks still to be Interim Stabilized
Isolated-Intrusion Prevention Completed (IP) <sup>c</sup>	99 single-shell	09/96 - date last IP occurred
Retrieval <sup>d</sup>	9 single-shell	10/02 - date effective
Misc. Underground Storage Tanks (MUST) and Special Surveillance Facilities (Active)	10 Tanks East Area 7 Tanks West Area	03/01 - last date a tank was added or removed from MUST list
Misc. Underground Storage Tanks (IMUST) and Special Surveillance Facilities (Inactive) <sup>e</sup>	18 Tanks East Area 25 Tanks West Area	11/01 - last date a tank was added or removed from IMUST list

<sup>a</sup> Of the 132 tanks classified as Interim Stabilized, 65 are listed as Assumed Leakers. (See Table B-5)

<sup>b</sup> Two of these tanks are Assumed Leakers (BY-105 and BY-106). (See Table B-5)

<sup>c</sup> Nine tanks were recategorized as "Retrieval" (see note <sup>d</sup> below).

<sup>d</sup> Tank Status for nine tanks (C-104, C-201, C-202, C-203, C-204, S-102, S-103, S-105 and S-106) was changed to "Retrieval," effective October 2002. (See Table B-1)

<sup>e</sup> Tables C-2 and C-3, the Inactive Miscellaneous Underground Storage Tanks (IMUST) now reflect only those tanks managed by CH2M HILL Hanford Group, Inc. (CH2M HILL).

**II. WASTE TANK INVESTIGATIONS**

This section includes all single- or double-shell tanks or catch tanks which are showing surface level or interstitial liquid level (ILL) decreases, or drywell radiation level increases in excess of established criteria.

A. Assumed Leakers or Assumed Re-leakers: (See Appendix D for definition of "Re-leaker")

This section includes all single- or double-shell tanks or catch tanks for which an off-normal or unusual occurrence report has been issued, or for which a waste tank investigation is in progress, for assumed leaks or re-leaks. Tanks/catch tanks will remain on this list until either a) completion of Interim Stabilization, b) the updated occurrence report indicates that the tank/catch tank is not an assumed leaker, or c) the investigation is completed.

There are none at this time.

III. SURVEILLANCE AND WASTE TANK STATUS HIGHLIGHTS

A. Single-Shell Tanks Saltwell Jet Pumping (See Table B-1 footnotes for further information)

Tank A-101 - Pumping began May 6, 2000. No pumping occurred between August 2000 and January 2002; pumping resumed January 17, 2002. No pumping in June 2002; the pump failed and was scheduled to be replaced. The pump was replaced and pumping was resumed on July 20, 2002. **Pumping was shut down on December 19, 2002, due to transducer failures. After three failed transducers were replaced, shutdown continued due to failure of two valves on A-B valve pit. No pumping in January 2003; a total of 508 Kgallons has been pumped since the start of pumping in May 2000.**

Tank AX-101 - Pumping began July 29, 2000. No pumping occurred between August 2000 and March 2001; pumping resumed March 22, 2001. Pumping was shut down on April 3, 2001, due to a transfer line failure. Pumping resumed February 1, 2002. **Pumping was shut down on January 14, 2003, in support of A-101 pit work. A total of 3 Kgallons was pumped in January 2003; a total of 363 Kgallons has been pumped since the start of pumping in July 2000.**

Tank BY-105 - Pumping began July 11, 2001. Pumping was shut down in August 2001 and resumed in December 2001. No pumping occurred between December and August 2002. Pumping resumed in August 2002. Pumping was shut down on August 30, 2002, because Double-Contained Receiver Tank (DCRT) BX-244 was full. Pumping was resumed September 1, 2002, after the waste was transferred. A total of 12 Kgallons was pumped in September 2002; a total of 45 Kgallons has been pumped from this tank since the start of pumping in July 2001.

This tank was placed under evaluation for meeting Interim Stabilization criteria as of September 13, 2002.

Tank BY-106 - Pumping began in August 1995 and was shut down in October 1995 due to an Unreviewed Safety Question (USQ) evaluation for flammable gas concerns. Pumping was restarted July 11, 2001. **A total of 7 Kgallons was pumped in January 2003; a total of 128 Kgallons has been pumped from this tank since the start of pumping in August 1995.**

Tank C-103 - Pumping began November 29, 2002, approximately five months ahead of schedule. **Pumping was shut down on January 11, 2003, to replace a pit flush pressure valve; the valve was replaced January 16, 2003. Several shutdowns and restarts occurred in January 2003 due to other problems. A total of 5 Kgallons was pumped in January 2003; a total of 112 Kgallons has been pumped from this tank since the start of pumping in November 2002.**

Tank S-101 - Pumping began July 27, 2002. **Pumping was restarted on January 16, 2003, and was shut down on January 25, 2003, to support SY exhauster maintenance. A total of 5 Kgallons was pumped in January 2003; a total of 30 Kgallons has been pumped from this tank since the start of pumping in July 2002.**

Tank S-102 - Pumping problems have forced many shutdowns. A total of 62 Kgallons has been pumped from this tank since the start of pumping in March 1999. A letter was sent to DOE-ORP in October 2002, requesting that this tank be removed from the Consent Decree stabilization requirements, and that the tank be considered for accelerated retrieval of the waste. See Table B-1 footnotes (top of page B-8) for more information.

Tank S-107 - Pumping began September 4, 2002, and shut down in October 2002. **Pumping was restarted December 28, 2002; pumping was shut down and restarted several times in January 2003 due to various problems. A total of 10 Kgallons was pumped in January 2003; a total of 46 Kgallons has been pumped from this tank since the start of pumping in September 2002.**

Tank S-111 - Pumping resumed December 18, 2001. (3 Kgallons were pumped in October 1975). The pump was shut down May 18, 2002 (see Table B-1 footnotes). Pumping started again on June 30, 2002, but the water added for pump priming/equipment flushes resulted in 0 Kgallons pumped in June 2002. **Pumping was shut down and restarted several times in January 2003, due to various equipment problems. Pumping was shut down on January 25, 2003, due to the hydrogen concentration approaching the control limit; pumping will resume when hydrogen levels decrease. A total of 8 Kgallons was pumped in January 2003; a total of 69 Kgallons has been pumped from this tank since the start of pumping in October 1975 (includes 3 Kgallons pumped in 1975).**

Tank S-112 - Pumping resumed September 21, 2002. (125 Kgallons were pumped in August 1978.) A total of 5 Kgallons was pumped in October 2002; a total of 133 Kgallons has been pumped from this tank since the start of pumping in August 1978. A letter was sent to DOE-ORP in October 2002, requesting that this tank be removed from the Consent Decree stabilization requirements, and that the tank be considered for accelerated retrieval of the waste. See Table B-1 footnotes (top of page B-8) for more information.

Tank SX-101 - Pumping began November 22, 2000. A total of 32 Kgallons has been pumped from this tank since the start of pumping in November 2000. No pumping has occurred since November 2001. Pumping was attempted in July 2002; but the jet pump was found plugged. **A Work Package has been prepared to replace the jet pump.**

Tank SX-102 - Pumping began December 15, 2001; a total of 1 Kgallon was pumped. Pumping was shut down on October 23, 2002, for a control system problem. **An automatic filling dilution tank system was installed and operating procedures were updated. The pump was restarted January 30, 2003. A total of 1 Kgallon was pumped in January 2003; a total of 44 Kgallons has been pumped since the start of pumping in December 2001.**

Tank SX-103 - Pumping began October 26, 2000. A total of 1 Kgallon was pumped in September 2002; a total of 134 Kgallons has been pumped from this tank since the start of pumping in October 2000.

This tank was placed under evaluation for meeting Interim Stabilization criteria on September 17, 2002.

Tank U-107 - Pumping began September 29, 2001. A letter was sent to DOE-ORP in October 2002, requesting that this tank be removed from the Consent Decree stabilization requirements, and that the tank be considered for accelerated retrieval of the waste. A total of 92 Kgallons has been pumped from this tank since the start of pumping in September 2001. See Table B-1 footnotes (top of page B-8) for further information.

Saltcake dissolution began on December 3, 2002; any additional pumping is associated with retrieval and will not be included in interim stabilization pumping volumes. **Waste volumes pumped during Saltcake Dissolution Proof of Concept work include both saltcake and water. The actual volume of waste removed from this tank will be calculated upon completion of the Saltcake Dissolution Proof of Concept Test.**

Tank U-108 - Pumping began December 2, 2001. **A total of 7 Kgallons was pumped in January 2003; a total of 60 Kgallons has been pumped from this tank since the start of pumping in December 2001.**

Tank U-111 - Pumping began June 14, 2002. **Pumping was shut down on January 5, 2003, and remains down due to transfer line restrictions between U-Farm and SY-Farm. A total of 1 Kgallon was pumped in January 2003; a total of 85 Kgallons has been pumped from this tank since the start of pumping in June 2002.**

## Footnotes:

1. All DST ENRAFs are connected to TMACS for continuous remote monitoring. All equipment connected to TMACS collects data multiple times per day regardless of required frequency.
2. Thermocouple tree risers followed by an asterisk (\*) are connected to TMACS for continuous remote monitoring. AY and AZ farms have too many thermocouple elements to list individually. Most are monitored electronically.

**This page intentionally left blank.**

APPENDIX B  
SINGLE-SHELL TANKS  
MONTHLY SUMMARY TABLES

TABLE B-1. INVENTORY AND STATUS BY TANK - SINGLE-SHELL TANKS

January 31, 2003

The SST volume estimates were derived from the Best-Basis Inventory baselining task, dated January 1, 2002, and represent the official waste volume estimates for Hanford's waste storage tanks. The interstitial liquid estimates for pumpable liquid remaining (PLR) and drainable linterstitial liquid (DIL) were calculated from these volumes using the waste phase drainable porosities per Updated Liquid Volume Estimates (HNF-2978 and RPP-5556).

BBI FY 2003 1st Qtr review resulted in volume changes to tanks A-101 and AX-101, December 31, 2002. These tanks no longer contain Retained Gas.

BBI FY 2003 2nd Qtr review resulted in minor volume changes to tanks A-102 and AX-101, January 31, 2003.

1 Kgal adjustments were made in tanks A-103 and B-108, to match the official Tank Transfer Database (TXFR), January 31, 2003.

Sludge and Saltcake volumes include Retained Gas, with the exception of A-101 and AX-101.

TABLE B-1. INVENTORY AND STATUS BY TANK - SINGLE-SHELL TANKS

January 31, 2003

The SST volume estimates were derived from the Best-Basis Inventory baselining task, dated January 1, 2002, and represent the official waste volume estimates for Hanford's waste storage tanks. The interstitial liquid estimates for pumpable liquid remaining (PLR) and drainable interstitial liquid (DIL) were calculated from these volumes using the waste phase drainable porosities per Updated Liquid Volume Estimates (HNF-2978 and RPP-5556).

BBI quarterly review resulted in changes to tank BY-106, effective December 31, 2002.

Sludge and Saltcake volumes include Retained Gas.

<b>16 TANKS - TOTALS</b>			<b>3033</b>							<b>573</b>	<b>2451</b>			
<b>GRAND TOTAL</b>			<b>31320</b>							<b>9755</b>	<b>21451</b>			

Notes: (1) The total waste volume includes a volume of retained gas that was calculated from tank measurements. Seven tanks are affected: A-101, AX-101, S-102, S-111, SX-105, U-103, and U-109. Gas in A-101 and AX-101 is assumed to have dissipated since pumping began.

(2) +/- 1 Kgal difference in volumes is due to rounding

B-7

HNF-EP-0182, Rev. 178

TABLE B-1. INVENTORY AND STATUS BY TANK – SINGLE-SHELL TANKS

December 31, 2002

Footnotes:

Stabilization information is from WHC-SD-RE-TI-178, "SST Stabilization Record," latest revision, or from the SST Stabilization Project, or the System Engineer.

Initial estimated Pumpable Liquid volumes (below) are based on HNF-2978, Rev. 4, "Updated Pumpable Liquid Volume Estimates and Jet Pump Operations for Interim Stabilization of Remaining Single-Shell Tanks," dated June 30, 2002.

Best Basis Inventory (BBI) 2003 1<sup>st</sup> Qtr review resulted in volume changes to the following tanks effective December 31, 2002: A-101, AX-101, BY-106, C-103, S-101, S-102, S-111, SX-105, TX-116, U-102, U-107, and U-111 (S-107 and U-108 were evaluated but no changes resulted).

**BBI 2003 2<sup>nd</sup> Qtr review resulted in minor volume changes to tanks A-102, AX-101, C-203, C-204, S-111, S-112, SX-102, and SX-114, January 31, 2003.**

**1 Kgal adjustments were made to tanks A-103, B-108, BY-103, BY-107, C-103, C-109, C-111, S-101, S-103, SX-106, TX-102, TX-104, TX-107, TX-115, TY-101, U-106, U-107, U-111, U-202, and U-203, to match the Tank Transfer Database (TXFR), January 31, 2003.**

HNF-2978, Rev. 4, resulted in changes to the following tanks, effective June 30, 2002: A-101, AX-101, BY-105, BY-106, C-103, S-101, S-102, S-107, S-111, S-112, SX-101, SX-102, SX-103, U-107, U-108, and U-111.

Tank Status for C-104, C-201, C-202, C-203, C-204, S-102, S-103, S-105, and S-106 was changed from Intrusion Prevention to "Retrieval" effective October 2002.

Letter to DOE-ORP, CHG-0203601 R1, dated October 15, 2002, requests that tanks S-102, S-112, and U-107 be removed from the Consent Decree stabilization requirements, and that the tanks be considered for accelerated retrieval of the waste. CH2M HILL recommends that waste retrieval and pumping commence prior to achieving the interim stabilization endpoint, as currently defined in the Interim Stabilization Consent Decree. This initiative will achieve the objective of early removal of waste from aging Single-Shell Tanks and will require an amendment to the Interim Stabilization Consent Decree.

(a) A-101 Initial estimated Pumpable Liquid volume: 610 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began on May 6, 2000. No pumping occurred from July 12, 2000, until January 17, 2002, when pumping resumed. Pumping was shut down March 27, 2002, due to high transfer line pressure; pumping resumed April 20, 2002.

Volumes reported in May 2002 and subsequent months reflect an error associated with the readings from the flowmeter (approximately a 1% deviation - the flowmeter is reading high). The final amount of waste transferred at the end of saltwell pumping will be adjusted to correct for this error; until then the volumes reported will be the actual volumes on the procedure data sheets.

The BBI quarterly update for December 31, 2002, indicates that this tank included interstitial liquid and gas, and it is assumed that the gas was dissipated during pumping; volumes have been adjusted to reflect this change. The total waste volume was reduced by 99 Kgal.

**Pumping was shut down on December 19, 2002, due to transducer failure. After three failed transducers were replaced shutdown continued due to failure of two valves in A-B valve pit. No pumping occurred in January 2003.**

Final volumes will be determined at completion of Interim Stabilization.

(b) AX-101 Initial estimated Pumpable Liquid volume: 365 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began July 29, 2000, shut down on August 11, 2000, and resumed March 22, 2001. Pumping was shut down April 3, 2001, due to failure of the transfer line. Pumping resumed

February 1, 2002, and was shut down again March 28, 2002, due to alarm #40 Power Monitor. Pumping was resumed April 9, 2002.

Volumes reported in May 2002 and subsequent months reflect an error associated with the readings from the flowmeter (approximately a 1% deviation - the flowmeter was reading high). The final amount of waste transferred at the end of saltwell pumping will be adjusted to correct for this error; until then the volumes reported will be the actual volumes on the procedure data sheets.

The BBI quarterly update for December 31, 2002, indicates that this tank included interstitial liquid and gas, and it is assumed that the gas was dissipated during pumping; volumes have been adjusted to reflect this change. The total waste volume was reduced by 46 Kgal.

**Pumping was shut down on January 14, 2003, in support of A-101 pit work.**

Final volumes will be determined at completion of Interim Stabilization.

(c) BY-105 Initial estimated Pumpable Liquid volume: 94 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began July 11, 2001. Pumping was shut down August 11, 2001, due to transfer line leak detectors not meeting all operability requirements of the TSR. Compensatory actions were established to allow resumption of pumping. Additionally, field work for Project W-314, "Tank Farm Upgrades," took the primary transfer route out of service. No pumping occurred from August to November 2001 when pumping resumed. No pumping occurred between December 2001 and August 2002; DCRT waste had to be transferred to tank AP-102 before pumping could resume. Pumping was restarted and shut down several times during August 2002. Pumping was shut down on August 30, 2002, because the DCRT was full: awaiting BX-244 transfer to AP-102. Pumping was restarted on September 1, 2002, and shut down on September 13, 2002. Troubleshooting indicates two possible problems: (1) a plugged backflow preventer downstream of the injection pump or (2) the thrust bearings in the transfer pump are worn out.

This tank was placed under evaluation for meeting Interim Stabilization criteria on September 13, 2002.

Final volumes will be determined at completion of Interim Stabilization

(d) BY-106 Initial estimated Pumpable Liquid volume: 103 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping was originally started August 10, 1995, and shut down October 17, 1995, due to an Unreviewed Safety Question (USQ) for flammable gas concerns.

Pumping was restarted July 11, 2001. Pumping was shut down August 11, 2001, due to transfer line leak detectors not meeting all operability requirements of the TSR. Compensatory actions were established to allow resumption of pumping. Additionally, field work for Project W-314, "Tank Farm Upgrades," took the primary transfer route out of service. Pumping resumed November 13, 2001. No pumping occurred between December 2001 and August 2002; DCRT waste had to be transferred to tank AP-102 before pumping could resume. Pumping was restarted, shut down, and restarted several times during August 2002. Pumping was shut down on August 30, 2002, because the DCRT was full: awaiting BX-244 transfer to AP-102. Pumping was shut down and restarted several times in early October 2002, and was shut down on October 9, 2002, to support maintenance work. Pumping was restarted November 16, 2002.

Final volumes will be determined at completion of Interim Stabilization

- (e) C-103 Initial estimated Pumpable Liquid volume: 80 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping was started on November 29, 2002, five months ahead of schedule. This is the last tank scheduled to begin pumping under the Interim Stabilization Consent Decree.

**Pumping was shut down on January 11, 2003, to replace a pit flush pressure valve; the valve was replaced January 16, 2003. Several shutdowns and restarts occurred in January 2003 due to other problems.**

- (f) S-101 Initial estimated Pumpable Liquid volume: 77 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began July 27, 2002. Pumping was shut down and restarted several times in August 2002; pumping was shut down on August 7, 2002. Pumping was shut down and restarted several times in October 2002; shut down on October 23, 2002, due to an alarm for the Programmable Logic Controller Communication (PLCC) link failing.

**Pumping was restarted on January 16, 2003, and was shut down on January 25, 2003, to support SY exhauster maintenance.**

Final volumes will be determined at completion of Interim Stabilization.

- (g) S-102 Initial estimated Pumpable Liquid volume: 156 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began March 18, 1999. Many pumping problems occurred over the following months, and the pump was replaced several times. Pumping was interrupted again in June 2000. No pumping occurred until May 10, 2002, when pumping resumed. The pump was manually shut down May 18, 2002. A Lock and Tag was hung to support Saltwell Tie-in work scheduled. Pumping resumed June 30, 2002. Pumping was shut down on October 15, 2002, because the analog/mechanical water meter is not advancing, and there is no way to track dilution additions until the water meter is repaired. A letter was sent to DOE-ORP on October 15, 2002 - see top of page B-8 for further information.

Final volumes will be determined at completion of Interim Stabilization

- (h) S-107 Initial estimated Pumpable Liquid volume: 61 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began on September 4, 2002. Pumping was shut down and restarted several times in October 2002; pumping shut down on October 17, 2002, due to a high bearing temperature. Failed recirculation line check valves are suspected. Pumping was restarted on December 28, 2002; and was shut down (and restarted) several times from December 28 through December 31, 2002, due to alarms from various sources.

**Pumping was restarted January 1, 2003; pumping was shut down and restarted several times in January 2003 due to various problems.**

- (i) S-111 Initial estimated Pumpable Liquid volume: 147 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began December 18, 2001. (Additionally, 3 Kgal were pumped in October 1975)  
Pumping was shut down on October 1, 2002 to support an S-complex outage. No pumping occurred in October 2002. Pumping was restarted on November 27, 2002.

**Pumping was shut down and restarted several times in January 2003, due to various equipment problems. Pumping was shut down on January 25, 2003, due to hydrogen concentration approaching control limit; pumping will resume when hydrogen levels decrease.**

Final volumes will be determined at completion of Interim Stabilization.

- (j) S-112 Initial estimated Pumpable Liquid volume: 67 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping resumed on September 21, 2002. (Initial saltwell pumping took place in August 1978, with a total of 125 Kgal being pumped at that time.) A letter was sent to DOE-ORP on October 15, 2002 - see top of page B-8 for further information.

- (k) SX-101 Initial estimated Pumpable Liquid volume: 80 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began November 22, 2000. No pumping has occurred since December 2000 due to failure of the pump. Pumping resumed September 21, 2001, following replacement of the saltwell pump and the lower piping. No pumping has occurred since November 2001. Attempts were made to restart pumping in July 2002; pumping remains down because jet/foot valve assembly is plugged.

**Work Package WS-02-646 has been prepared for the jet pump replacement.**

Final volumes will be determined at completion of Interim Stabilization.

- (l) SX-102 Initial estimated Pumpable Liquid volume: 106 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began December 15, 2001. Pumping was shut down on August 14, 2002, in support of S-107 field work. Pumping was manually shut down on October 23, 2002, due to an alarm for the PLCC failure alarm in S-101 not shutting the pump down. **An automatic filling dilution tank system was installed and operating procedures were updated. The pump was restarted January 30, 2003.**

Final volumes will be determined at completion of Interim Stabilization.

- (m) SX-103 Initial estimated Pumpable Liquid volume: 175 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began October 26, 2000. Pumping was shut down April 22, 2001, due to leak detector and subsequent shielding problems in the pump pit. Pumping resumed September 14, 2001. Pumping was shut down on August 14, 2002, in support of S-107 field work. Pumping was restarted September 1, 2002, and was shut down on September 17, 2002.

This tank was placed under evaluation for meeting Interim Stabilization criteria on September 17, 2002.

Final volumes will be determined at completion of Interim Stabilization

- (n) U-107 Initial estimated Pumpable Liquid volume: 115 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began September 29, 2001. Pumping was shut down on September 11, 2002. The pump had failed, and was replaced on October 21, 2002. A letter was sent to DOE-ORP on October 15, 2002 - see top of page B-8 for further information.

Final volumes will be determined at completion of Interim Stabilization

Saltcake dissolution began on December 3, 2002; any additional pumping is associated with retrieval and will not be included in interim stabilization pumping volumes.

**All volumes of waste pumped from tank U-107 during Saltcake Dissolution Proof of Concept Test include both saltcake and water. The actual volume of waste removed from this tank will be calculated upon completion of the Saltcake Dissolution Proof of Concept Test.**

- (o) U-108 Initial estimated Pumpable Liquid volume: 120 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began December 2, 2001. No pumping occurred in April 2002; pumping remains down due to a partially plugged transfer line. Pumping was restarted briefly on May 18, 2002. The pump shut down several times due to alarming and was restarted in bypass mode. From May 18 to May 31, 2002, various Trouble Alarms were intermittently activated. During June 2002, this pump was restarted and shut down several times. As of June 30, 2002, it was still shut down due to transfer line restrictions. Pumping resumed in July 2002. Pumping was shut down on September 30, 2002, for planned SY exhaustor outage. Pumping was restarted and shut down several times in October 2002. Pumping was restarted November 3, 2002.

Final volumes will be determined at completion of Interim Stabilization.

(p) U-111 Initial estimated Pumpable Liquid volume: 77 Kgal (HNF-2978, Rev. 4, effective June 30, 2002)

Pumping began on June 14, 2002. Pumping was shut down and restarted several times in October 2002.

**January 2003 - the actual volume pumped has exceeded the estimated PLR and DLR. The estimate will be updated when HNF-2978 is revised.**

**Pumping was shut down on January 5, 2003, and remains down due to transfer line restrictions between U-Farm and SY-Farm.**

Final volumes will be determined at completion of Interim Stabilization.

TABLE B-2. SINGLE-SHELL TANKS STABILIZATION STATUS SUMMARY

Not Yet Interim Stabilized	17
<b>Total Single-Shell Tanks</b>	<b>149</b>

## TABLE B-3. SINGLE-SHELL TANKS INTERIM STABILIZATION STATUS

## Footnotes: (in chronological order)

- (1) These dates indicate when the tanks were actually interim stabilized. In some cases, the official interim stabilization documents were issued at a later date.
- (2) Although tanks BX-103, T-102, and T-112 met the interim stabilization administrative procedure at the time they were stabilized, they no longer meet the recently updated administrative procedure. The tanks were re-evaluated in 1996 and letter 9654456, J. H. Wicks to J. K. McClusky, DOE-RL, dated September 30, 1996, was issued which recommended that no further pumping be performed on these tanks, based on an economic evaluation.

Document RPP-5556, Rev. 0, "Updated Drainable Interstitial Liquid Volume Estimates for 119 Single-Shell Tanks Declared Stabilized," J. G. Field, February 7, 2000, states that five tanks no longer meet the stabilization criteria (BX-103, T-102, and T-112 exceed the supernatant criteria, and BY-103 and C-102 exceed the Drainable Interstitial Liquid [DIL] criteria).

An intrusion investigation was completed on tank B-202 in 1996 because of a detected increase in surface level. As a result of this investigation, it was determined that this tank no longer meets the recently updated administrative procedure for 200 series tanks.

- (3) Earlier versions of HNF-SD-RE-TI-178, "SST Stabilization Record," indicated that original Interim Stabilization data are missing on four tanks: B-201, T-102, T-112, and T-201. HNF-SD-RE-TI-178, Rev. 7, dated February 9, 2001, added three additional tanks to those missing stabilization data: A-104, BX-101, and SX-115.
- (4) Tank T-104 was declared Interim Stabilized on November 19, 1999. In-tank video taken October 7, 1999, shows the surface is clearly sludge-type waste with no saltcake present. There is no visible supernatant on the surface. Waste surface appears level across tank with numerous cracks. There is a minimal collapsed area around the saltwell screen, with no visible bottom.
- (5) Tank T-110 was declared Interim Stabilized on January 5, 2000, after a major equipment failure. An in-tank video taken October 7, 1999 (pumping was discontinued on August 12, 1999), showed the surface of this tank as smooth, brown-tinted sludge with visible cracks.
- (6) Tank S-103 was declared Interim Stabilized on April 18, 2000. The surface is a rough, black and brown-colored waste with yellow patches of saltcake visible throughout. The surface appears to be damp, but not saturated, and shows irregular cracking typically seen with surfaces beginning to dry out. A pool of supernatant (10 feet in diameter, 5 feet deep, 1.0 Kgallons) is visible from video observations.
- (7) Tank SX-104 was declared Interim Stabilized on April 26, 2000, after a major equipment failure. The surface is a rough, yellowish gray saltcake waste with an irregular surface of visible cracks and shelves that were created as the surface dried out. The waste surface appears to be dry and shows no standing liquid within the tank.
- (8) Tank SX-106 was declared Interim Stabilized on May 5, 2000. The surface is a smooth, white-colored saltcake waste. The surface level slopes slightly from the tank sidewall down to a large depression in the center of the tank. A second depression surrounds both saltwell screens and an abandoned Liquid Observation Well (LOW). The waste surfaces appear dry and show no standing liquid within the tank.

- (9) Tank U-103 was declared Interim Stabilized on September 11, 2000. The surface is a brown colored waste with irregular patches of white salt crystal. Approximately 30% of the waste surface is covered by the salt formations. The surface level slopes slightly from the tank sidewall down to the first of two depressions in the center of the tank. The waste surface appears dry and shows signs of drying and cracking due to saltwell pumping. LOW readings indicate an average adjusted ILL of 60.2 inches. There is a small pool of supernatant estimated to be 500 gallons.
- (10) Tank S-106 was declared Interim Stabilized on February 1, 2001. The surface is a rough, brown and yellow-colored saltcake waste with an irregular surface of mounds and saltcake crystals that were created as the surface was dried out. The waste surface appears to be dry and shows no standing liquid within the tank. There is no evidence of supernatant from video observations. The waste surface slopes gradually from the tank sidewall to the depression in the center of the tank. The depression surrounds both of the saltwell screens, but does not extend around the temperature probe and ENRAF devices.
- (11) Tank U-105 was declared Interim Stabilized on March 29, 2001, after a major equipment failure. The surface is a brown colored waste with irregular patches of white salt crystal. Approximately 15% of the surface is covered by the salt formations. The surface level slopes to the first of two depressions in the center of the tank; the first depression is cone shaped and estimated to be 22 feet in diameter. The second depression, inside the first, is cylindrically shaped and has a diameter of approximately 10 feet. Both depressions are centered on the saltwell screen. The waste surface appears dry and shows signs of cracking due to saltwell pumping. There is no visible liquid in the tank.
- (12) Tank U-106 was declared Interim Stabilized on March 9, 2001. The surface is a dark brown/yellow colored waste that is covered with many stalagmite-type crystals growing on the surface. The crystals cover approximately 75% of the waste surface. The waste surface is irregular, appears dry, and shows only minimal signs of cracking due to saltwell pumping. The supernatant pool is estimated to be 13.3 feet in diameter based on the visible portion of the saltwell screen. The pool is centered on the saltwell screen.
- (13) Tank S-109 was declared Interim Stabilized on June 11, 2001. The surface is primarily a white colored salt crystal with small patches of dark salt visible due to saltwell/sampling activities. Approximately 95% of the waste surface is covered by the salt formations. The surface level slopes slightly from the tank sidewall down to a depression in the center of the tank. The waste surface appears rough and dry and shows signs of cracking and slumping due to saltwell pumping.
- (14) Tank U-109 was declared Interim Stabilized on April 5, 2002. The declaration letter to DOE was issued on June 20, 2002. The surface is primarily a brown colored waste with irregular patches of white salt crystal. Approximately 70% of the waste surface is covered by the salt formations. The surface level slopes slightly from the tank sidewall down to a depression in the center of the tank. The depression is cone shaped and is centered on the saltwell screen. The waste surface appears dry and shows signs of cracking due to saltwell pumping. There is no visible liquid within the tank.
- (15) Tank U-102 was declared Interim Stabilized on June 19, 2002. The declaration letter to DOE was issued June 28, 2002. The surface is primarily a gray-brown colored cracked waste with irregular patches of white salt crystal. Approximately 50% of the waste surface is covered by the salt formations. The surface level slopes slightly from the tank sidewall down to a depression in the center of the tank. The depression is cone shaped and is centered on the saltwell screen. The waste surface appears dry and shows signs of cracking due to saltwell pumping. There is approximately a 5-foot wide pool of visible liquid within the saltwell screen depression.
- (16) Tank SX-105 was declared Interim Stabilized on August 1, 2002; the declaration letter to DOE was issued August 20, 2002. The surface is a rough, yellowish-gray saltcake waste with an irregular surface of visible cracks and shelves due to saltwell pumping. The waste surface appears to be dry and shows no standing water within the tank. The waste surface slopes gradually from the tank sidewall to the center of the tank. There are no large depressions in or around the center of the tank.

TABLE B-4. SINGLE-SHELL TANK INTERIM STABILIZATION MILESTONES  
January 31, 2003

New single-shell tank interim stabilization milestones were negotiated in 1999 and are identified in the "Consent Decree." The Consent Decree was approved on August 16, 1999.

CONSENT DECREE  
Attachments A-1 and A-2

The following table is the schedule for pumping liquid waste from the remaining twenty-nine (29) single-shell tanks. This schedule is enforceable pursuant to the terms of the Decree except for the "Projected Pumping Completion Dates," which are estimates only and not enforceable. Also, this schedule does not include tank C-106.

Tank Designation	Project Pumping Start Date	Actual Pumping Start Date	Projected Pumping Completion Date	Interim Stabilization Date
1. T-104	Already initiated	March 24, 1996	May 30, 1999	November 19, 1999
2. T-110	Already initiated	May 12, 1997	May 30, 1999	January 5, 2000
3. SX-104	Already initiated	September 26, 1997	December 30, 2000	April 26, 2000
4. SX-106	Already initiated	October 6, 1998	December 30, 2000	May 5, 2000
5. S-102	Already initiated	March 18, 1999	March 30, 2001	
6. S-106	Already initiated	April 16, 1999	March 30, 2001	February 1, 2001
7. S-103	Already initiated	June 4, 1999	March 30, 2001	April 18, 2000
8. U-103 *	June 15, 2000	September 26, 1999	April 15, 2002	September 11, 2000
9. U-105 *	June 15, 2000	December 10, 1999	April 15, 2002	March 29, 2001
10. U-102 *	June 15, 2000	January 20, 2000	April 15, 2002	June 19, 2002
11. U-109 *	June 15, 2000	March 11, 2000	April 15, 2002	April 5, 2002
12. A-101	October 30, 2000	May 6, 2000	September 30, 2003	
13. AX-101	October 30, 2000	July 29, 2000	September 30, 2003	
14. SX-105	March 15, 2001	August 8, 2000	February 28, 2003	August 1, 2002
15. SX-103	March 15, 2001	October 26, 2000	February 28, 2003	
16. SX-101	March 15, 2001	November 22, 2000	February 28, 2003	
17. U-106 *	March 15, 2001	August 24, 2000	February 28, 2003	March 9, 2001
18. BY-106	July 15, 2001	July 11, 2001	June 30, 2003	
19. BY-105	July 15, 2001	July 11, 2001	June 30, 2003	
20. U-108	December 30, 2001	December 2, 2001	August 30, 2003	
21. U-107	December 30, 2001	September 29, 2001	August 30, 2003	
22. S-111	December 30, 2001	December 18, 2001	August 30, 2003	
23. SX-102	December 30, 2001	December 15, 2001	August 30, 2003	
24. U-111	November 30, 2002	June 14, 2002	September 30, 2003	
25. S-109	November 30, 2002	September 23, 2000	September 30, 2003	June 11, 2001
26. S-112	November 30, 2002	September 21, 2002	September 30, 2003	
27. S-101	November 30, 2002	July 27, 2002	September 30, 2003	
28. S-107	November 30, 2002	September 4, 2002	September 30, 2003	
29. C-103	Pumping operations began in this tank on November 29, 2002, approximately five months ahead of the scheduled start date of April 2003. It is the final tank to begin pumping operations specified in this Decree.			

\* Tanks containing organic complexants.

Completion of Interim Stabilization. DOE will complete interim stabilization of all 29 single-shell tanks listed above by September 30, 2004.

Percentage of Pumpable Liquid Remaining to be Removed:

93% of Total Liquid	9/30/1999 (1)
38% of Organic Complexed Pumpable Liquids	9/30/2000 (2)
5% of Organic Complexed Pumpable Liquids	9/30/2001 (3)
18% of Total Liquid	9/30/2002 (4)
2% of Total Liquid	9/30/2003

The "percentage of pumpable liquid remaining to be removed" is calculated by dividing the volume of pumpable liquid remaining to be removed from tanks not yet interim stabilized by the sum of the total amount of liquid that has been pumped and the pumpable liquid that remains to be pumped from all tanks.

- (1) The Pumpable Liquid Remaining was reduced to 88% by September 30, 1999. Reference LMHC-9957926 R1, D. I. Allen, LHMC, to D. C. Bryson, DOE-ORP, dated October 26, 1999.
- (2) The Complexed Pumpable Liquid Remaining was reduced to 38% by September 15, 2000. Reference CHG-0004752, R. F. Wood, CHG, to J. J. Short, DOE-ORP, dated September 13, 2000.
- (3) Reference CHG-0104859, R. F. Wood, CHG, to J. S. O'Connor, DOE-ORP, dated September 20, 2001: this reference states that tanks U-102 and U-109 appear to have met the interim stabilization criteria, thereby reducing the Complexed Pumpable Liquid Remaining to zero. Reference CHG-0202630, dated June 20, 2002, declared tank U-109 Interim Stabilized and confirmed the completion of Consent Decree milestone, Attachment A, Item 11, as well as the partial completion of milestone D-001-004-T01. Reference CHG-0202901, dated June 28, declared tank U-102 Interim Stabilized and confirmed the completion of Consent Decree milestone, Attachment A, Item 10, as well as the partial completion of milestone D-001-004-T01.
- (4) Reference CHG-0204571, J. C. Fulton, CHG, to J. E. Rasmussen, DOE-ORP, dated September 26, 2002: this reference states that Consent Decree Milestone D-001-12V "The Percentage of Pumpable Liquid Remaining to be Removed Will be Equal To or Less Than 18% of Total Liquid," will be completed by September 30, 2002. Reference CHG-204636, R. F. Wood, CHG, to J. S. O'Connor, DOE-ORP, dated September 30, 2002: this reference states that the milestone was met on September 28, 2002. The percentage of pumpable liquid remaining was 17.94% or less than 550 Kgallons.

TABLE B-5. SINGLE-SHELL TANK LEAK VOLUME ESTIMATES (Sheet 1 of 6)

January 31, 2003

N/A = not applicable (not yet interim stabilized)

TABLE B-5. SINGLE-SHELL TANKS LEAK VOLUME ESTIMATES

Footnotes:

(1) Current estimates [see Reference (b)] are that 610 Kgallons of cooling water was added to tank A-105 from November 1970 to December 1978 to aid in evaporative cooling. In accordance with Dangerous Waste Regulations [Washington Administrative Code 173-303-070 (2)(a)(ii), as amended, Washington State Department of Ecology, 1990, Olympia, Washington], any of this cooling water that has been added and subsequently leaked from the tank must be classified as a waste and should be included in the total leak volume. In August 1991, the leak volume estimate for this tank was updated in accordance with the WAC regulations. Previous estimates excluded the cooling water leaks from the total leak volume estimates because the waste content (concentration) in the cooling water which leaked should be much less than the original liquid waste in the tank (the sludge is relatively insoluble). The total leak volume estimate in this report (10 to 277 Kgallons) is based on the following (see References):

1. Reference (b) contains an estimate of 5 to 15 Kgallons for the initial leak prior to August 1968.
2. Reference (b) contains an estimate of 5 to 30 Kgallons for the leak while the tank was being sluiced from August 1968 to November 1970.
3. Reference (b) contains an estimate of 610 Kgallons of cooling water added to the tank from November 1970 to December 1978, but it was estimated that the leakage was small during this period. This reference contains the statement "Sufficient heat was generated in the tank to evaporate most, and perhaps nearly all, of this water." This results in a low estimate of zero gallons leakage from November 1970 to December 1978.
4. Reference (c) contains an estimate the 378 to 410 Kgallons evaporated out of the tank from November 1970 to December 1978. Subtracting the minimum evaporation estimate from the cooling water added estimate provides a range from 0 to 232 Kgallons of cooling water leakage from November 1970 to December 1978.

	<u>Low Estimate</u>	<u>High Estimate</u>
Prior to August 1968	5,000	15,000
August 1968 to November 1970	5,000	30,000
November 1970 to December 1978	<u>0</u>	<u>232,000</u>
Totals	10,000	277,000

- (2) These leak volume estimates do not include (with some exceptions), such things as: (a) cooling/raw water leaks, (b) intrusions (rain infiltration) and subsequent leaks, (c) leaks inside the tank farm but not through the tank liner (surface leaks, pipeline leaks, leaks at the joint for the overflow or fill lines, etc.), and (d) leaks from catch tanks, diversion boxes, encasements, etc.
- (3) In many cases, a leak was suspected long before it was identified or confirmed. For example, Reference (d) shows that tank U-104 was suspected of leaking in 1956. The leak was confirmed in 1961. This report lists the "assumed leaker" date of 1961. Using present standards, tank U-104 would have been declared an assumed leaker in 1956. In 1984, the criteria designations of "suspected leaker," "questionable integrity," "confirmed leaker," "declared leaker," and "borderline and dormant" were merged into one category now reported as "assumed leaker." See Reference (f) for explanation of when, how long, and how fast some of the tanks leaked. It is highly likely that there have been undetected leaks from single-shell tanks because of the nature of their design and instrumentation.
- (4) The leak volume estimate date for these tanks is before the declared leaker date because the tank was in a suspected leaker or questionable integrity status; however, a leak volume had been estimated prior to the tank being reclassified.

- (5) The increasing radiation levels in drywells and laterals associated with these three tanks could be indicating continuing leak or movement of existing radionuclides in the soil. There is no conclusive way to confirm these observations. (Repeat spectral drywell scans are not part of the current Tank Farm leak detection program but can be run on request a special needs arise. A select subset of drywells is routinely monitored by the Vadose Zone Characterization Project to assess movement of gamma-emitting radionuclides in the subsurface. There are currently no functioning laterals and no plan to prepare them for use).
- (6) Methods were used to estimate the leak volumes from these 19 tanks based on the assumption that their cumulative leakage is approximately the same as for 18 of the 24 tanks identified in footnote (9). For more details see Reference (g). The total leak volume estimate for these tanks is 150 Kgallons (rounded to the nearest Kgallon), for an average of approximately 8 Kgallons for each of 19 tanks.
- (7) The total has been rounded to the nearest 50 Kgallons. Upper bound values were used in many cases in developing these estimates. It is likely that some of these tanks have not actually leaked.
- (8) Leak volume estimate is based solely on observed liquid level decreases in these tanks. This is considered to be the most accurate method for estimating leak volumes.
- (9) The curie content shown is as listed in the reference document and is not decayed to a consistent date; therefore, a cumulative total is inappropriate.
- (10) Tank C-101 experienced a liquid level decrease in the late 1960s and was taken out of service and pumped to a minimum heel in December 1969. In 1970, the tank was classified as a "questionable integrity" tank. Liquid level data show decreases in level throughout the 1970s and the tank was saltwell pumped during the 1970s, ending in April 1979. The tank was reclassified as a "confirmed leaker" in January 1980. See References (q) and (r); refer to Reference (s) for information on the potential for there to have been leaks from other C-farm tanks (specifically, C-102, C-103, and C-109).
- (11) These dates indicate when the tanks were declared to be interim stabilized. In some cases, the official interim stabilization documents were issued at a later date. Also, in some cases, the field work associated with interim stabilization was completed at an earlier date.
- (12) Tank T-111 was declared an "assumed re-leaker" on February 28, 1994, due to a decreasing trend in surface level measurement. This tank was pumped, and interim stabilization completed on February 22, 1995.
- (13) Tank BX-111 was declared an "assumed re-leaker" in April 1993. Preparations for pumping were delayed, following an administrative hold placed on all tank farm operations in August 1993. Pumping resumed and the tank was declared interim stabilized on March 15, 1995.
- (14) The leak volume and curie release estimates on tanks SX-108, SX-109, SX-111, and SX-112 have been re-evaluated using a Historical Leak Model [see Reference (t)]. In general, the model estimates are much higher than the values listed in the table, both for volume and curies released. The values listed in the table do not reflect this revised estimate because, "In particular, it is worth emphasizing that this report was never meant to be a definitive update for the leak baseline at the Hanford Site. It was rather meant to be an attempt to view the issue of leak inventories with a new and different methodology." (This quote is from the first page of the referenced report).
- (15) In July 1998, the Washington State Department of Ecology (Ecology) directed the U.S. Department of Energy (DOE) to develop corrective action plans for eight single-shell tank farms (B/BX/BY/S/SX/T/TX/TY) where groundwater contamination likely originated from tank farm operations. A Tri-Party Agreement milestone (M-45 series) was developed that established a formalized approach for evaluating impacts on groundwater quality of loss of tank wastes to the vadose zone underlying these tank farms. Planning documents have been completed for the B, BX, BY, S, SX, T, TX, and TY tank farms. The phase 1 field investigation was completed in the B, BX, BY, S, and SX tank farms. Field work was

completed for the TX tank farm and is underway in the T and TY tank farms. Documentation preparation for field characterization of the remaining four single-shell tank farms is underway.

SST Vadose Zone Project drilling and testing activities near tank BX-102 were completed in March 2001. A borehole (299-E33-45) was drilled through the postulated uranium plume resulting from the 1951 tank BX-102 overflow event to confirm the presence of uranium, define its present depth, and survey other contaminants of interest such as Tc-99. Thirty-five split-spoon samples were collected for laboratory analyses. This borehole was decommissioned after collection and analysis of groundwater samples.

Borehole W33-46, adjacent to tank B-110, was drilled to a depth of approximately 190 feet in July 2001. Soil samples were collected for analysis as part of the tank farm vadose zone characterization activities. During decommissioning, this borehole was completed as a vadose zone monitoring structure. Work was accomplished in cooperation with scientists from Idaho National Engineering and Environmental Laboratory and Pacific Northwest National Laboratory. This borehole is now the first fully instrumented vadose zone hydrographic monitoring structure to be completed in a Hanford site tank farm.

On July 31, 2002, the Washington State Department of Ecology issued a letter-directive in response to RPP-10757 which suggested a path forward in dealing with the high <sup>99</sup>Tc activity in groundwater at well 299-W23-19 near tank SX-115. No formal remediation is required, however, extensive purging of the well is to be done concurrent with quarterly sampling. In addition, an array of specific conductivity probes is to be placed in the well to monitor the electrical properties of the water (<sup>99</sup>Tc activity is directly proportional to nitrate concentration, and nitrate concentration is proportional to electrical conductivity). A data logger with remote reading capability will be installed together with the specific conductivity probes. Because large volumes of water are to be removed, and because the aquifer is incapable of supporting a high-rate pump, the capability for pumping this well from outside the tank farm fence (to allow non-tank farm trained personnel to operate the pumping system) is to be installed by March 2003.

## Footnotes:

- Any ENRAF (E) or thermocouple tree riser that is followed by an asterisk (\*) is connected to TMACS for continuous remote monitoring. If there is no asterisk, only manual readings are obtained. Any equipment connected to TMACS collects data multiple times per day, regardless of required frequency.
- A-101 LOW riser was damaged during saltwell pumping in February 2002. The LOW has failed and dip tube readings are being taken on saltwell pumping (SWP) data sheets. The LOW is not required for leak detection during SWP activity per OSD-T-151-00031; when the SWP activity is complete, the LOW be required to be functional. Weight factor and specific gravity readings are currently being taken.
- TX-108 LOW is only monitored on request. Last reading was July 1994.
- B-105 ENRAF electronic data are inconsistent. The ENRAF is in "fail mode." The LOW is the primary leak detection device for this tank.
- SX-102 LOW is O/S as of 7/17/02. A sharp increase in radiation levels was detected inside the LOW; **Problem Evaluation Request (PER) 2002-3914 was issued. Weight factor and specific gravity readings are required weekly in this tank when the saltwell pump is not operating to avoid an OSD violation. The automatic ENRAF provides daily readings.**
- TX-116 LOW was breached in August 2002. The ENRAF failed during the LOW installation in March 2002. The ENRAF was removed when the LOW was breached and has not been replaced. The new LOW was not installed in time for the 4th quarter reading for OSD-T-151-00031 compliance. This tank has incurred an LOW OSD violation; PER 2002-6058 was issued, requiring a functional LOW to be installed by February 28, 2003. The LOW is the primary leak detection device. The ENRAF has been recording surface level readings on TMACS since October 31, 2002.
- BX-111 and BX-112 temperature electronic recording units have failed; they need to be replaced.
- SX-107 temperatures are inconsistent in TMACS since September 23, 2002. SX-108 temperatures are inconsistent since March 7, 2002; the semiannual reading was last taken July 2, 2002. Manual readings are taken weekly in both tanks.

Footnotes (continued)

9. U-107 ENRAF was discovered in "fail mode." The plummet appears to be stuck in the waste. PER 2002-5971 has been issued to flush the ENRAF. The LOW is the primary leak detection device.
10. **B-107 and BX-109 LOWs were installed on January 22 and January 9, 2003, respectively. T-109 LOW was installed on January 15, 2003.**
11. **U-101 ENRAF replaced the MT on January 15, 2003, and has been baselined.**
12. **BY-103 temperature electronic recording unit failed in Riser 5 on October 26, 2002. Weekly readings are being taken by Instrument Technicians.**
13. **S-105 ENRAF failed on January 29, 2003. It will need to be flushed and recalibrated. The LOW is the primary leak detection device.**
14. **S-108 temperature electronic recording unit failed March 3, 2002. Semiannual temperature readings were taken July 2002 and January 2003.**
15. **C-111 ENRAF replaced the MT on January 28, 2003.**

APPENDIX D  
GLOSSARY OF TERMS

TABLE D-1. GLOSSARY OF TERMS

1. DEFINITIONS

WASTE TANKS - General

Waste Tank Safety Issue

A potentially unsafe condition in the handling of waste material in underground storage tanks that requires corrective action to reduce or eliminate the unsafe condition. There are currently no waste tank safety issues.

Characterization

Characterization is understanding the Hanford tank waste chemical, physical, and radiological properties to the extent necessary to ensure safe storage and interim operation, and ultimate disposition of the waste.

WASTE TYPES

Aging Waste (AW)

High level, first cycle solvent extraction waste from the PUREX plant (NCAW).

Concentrated Complexant (CC)

Concentrated product from the evaporation of dilute complexed waste.

Concentrated Phosphate Waste (CP)

Waste originating from the decontamination of the N Reactor in the 100 N Area. Concentration of this waste produces concentrated phosphate waste.

Dilute Complexed Waste (DC)

Characterized by a high content of organic carbon including organic complexants: ethylenediaminetetraacetic acid (EDTA), citric acid, and hydroxyethyl-ethylenediaminetriacetic acid (HEDTA), were the major complexants used. Main sources of DC waste in the DST system are saltwell liquid inventory (from SSTs).

Dilute Non-Complexed Waste (DN)

Low activity liquid waste originating from S and T Plants, the 300 and 400 Areas, PUREX facility (decladding supernatant and miscellaneous wastes), 100 N Area (sulfate waste), B Plant, saltwells, and PFP (supernatant).

Drainable Interstitial Liquid (DIL)

Interstitial liquid that is not held in place by capillary forces and will, therefore, migrate or move by gravity.

Double-Shell Slurry (DSS)

Waste that exceeds the sodium aluminate saturation boundary in the evaporator without exceeding receiver tank composition limits. For reporting purposes, DSS is considered a solid.

Double-Shell Slurry Feed (DSSF)

Waste concentrated just before reaching the sodium aluminate saturation boundary in the evaporator without exceeding receiver tank composition limits. This form is not as concentrated as DSS.

Evaporator Feed Tank (EVFD)

Dilute waste staged for evaporation; waste type will vary (usually DN or DC).

Slurry Receiver Tank (SRCVR)

Concentrated waste produced by evaporation; waste type will vary (usually DSSF or CC).

Supernatant Liquid

The liquid above the solids or in large liquid pools covered by floating solids in waste storage tanks.

INTERIM STABILIZATION (Single-Shell Tanks only)

Interim Stabilized (IS)

A tank which contains less than 50 Kgallons of drainable interstitial liquid and less than 5 Kgallons of supernatant. If the tank was jet pumped to achieve interim stabilization, then the jet pump flow or saltwell screen inflow must also have been at or below 0.05 gpm before interim stabilization criteria are met.

Jet Pump

The jet pump system includes 1) a jet assembly with foot valve mounted to the base of two pipes that extend from the top of the well casing to near the bottom of the well casing inside the saltwell screen, 2) a centrifugal pump to supply power fluid to the down-hole jet assembly, 3) flexible or rigid transfer jumpers, 4) a flush line, and 5) a flowmeter. The jumpers contain piping, valves, and pressure and limit switches.

The centrifugal pump and jet assembly are needed to pump the interstitial liquid from the saltwell screen into the pump pit, nominally a 40-foot elevation rise. The power fluid passes through a nozzle in the jet assembly and acts to convert fluid pressure head to velocity head, thereby reducing the pressure in the jet assembly chamber. The reduction in pressure allows the interstitial liquid to enter the jet assembly chamber and mix with the power fluid. Velocity head is converted to pressure head above the nozzle, lifting power fluid, and interstitial liquid to the pump pit. Pumping rates vary from 0.05 to about 4 gpm.

Saltwell Screen

The saltwell system is a 10-inch diameter saltwell casing consisting of a stainless steel saltwell screen welded to a Schedule 40 carbon steel pipe. The casing and screen are to be inserted into the 12-inch tank riser located in the pump pit. The stainless steel screen portion of the system will extend through the tank waste to near the bottom of the tank. The saltwell screen portion of the casing is an approximately 10-foot length of 300 Series, 10-inch diameter, stainless steel pipe with screen openings (slots) of 0.05 inches.

Emergency Pumping Trailer

A 45-foot tractor-type trailer is equipped to provide storage space and service facilities for emergency pumping equipment: this consists of two dedicated jet pump jumpers and two jet pumps, piping and dip tubes for each, two submersible pumps and attached piping, and a skid-mounted Weight Factor Instrument Enclosure with an air compressor and electronic recording instruments. The skid also contains a power control station for the pumps, pump pit leak detection, and instrumentation. A rack for over 100 feet of overground double-contained piping is also in the trailer.

INTRUSION PREVENTION (ISOLATION) (Single-Shell Tanks only)

Partially Interim Isolated (PI)

The administrative designation reflecting the completion of the physical effort required for Interim Isolation except for isolation of risers and piping that is required for jet pumping or for other methods of stabilization.

Interim Isolated (II)

The administrative designation reflecting the completion of the physical effort required to minimize the addition of liquids into an inactive storage tank, process vault, sump, catch tank, or diversion box. In June 1993 the term "Interim Isolation" was replaced by "Intrusion Prevention."

Intrusion Prevention (IP)

Intrusion Prevention is the administrative designation reflecting the completion of the physical effort required to minimize the addition of liquids into an inactive storage tank, process vault, sump, catch tank, or diversion box. Under no circumstances are electrical or instrumentation devices disconnected or disabled during the intrusion prevention process (with the exception of the electrical pump).

### Retrieval (R)

The process of removing, to the maximum extent practical, all the waste from a given underground storage tank. The retrieval process is selected specific to each tank and accounts for the waste type stored and the access and support systems available. Generally, retrieval is focused on removal of solids from the tank.

### Final Closure

Final closure of the operable units (tank farms) shall be defined as regulatory approval of completion of closure actions and commencement of post-closure actions. For the purposes of this agreement (Hanford Federal Facility Agreement and Consent Order Change Control Form, Change Number M-45-02-03), all units located within the boundary of each tank farm will be closed in accordance with Washington Administrative Code 173-303-610. In evaluating closure operations for single-shell tanks, contaminated soil, and ancillary equipment, the Washington State Department of Ecology and the Washington State Environmental Protection Agency will consider cost, technical practicability, and potential exposure to radiation. Closure of all units within the boundary of a given tank farm will be addressed in a closure plan for single-shell tanks.

## TANK INTEGRITY

### Sound

The integrity classification of a waste storage tank for which surveillance data indicate no loss of liquid attributed to a breach of integrity.

### Assumed Leaker

The integrity classification of a waste storage tank for which surveillance data indicate a loss of liquid attributed to a breach of integrity.

### Assumed Re-Leaker

A condition that exists after a tank has been declared as an "assumed leaker" and then the surveillance data indicate a new loss of liquid attributed to a breach of integrity.

## TANK INVESTIGATION

### Intrusion

A term used to describe the infiltration of liquid into a waste tank.

## SURVEILLANCE INSTRUMENTATION

### Drywells

Historically, the drywells were monitored with gross logging tools as part of a secondary leak monitoring system. In some cases, neutron-moisture sensors were used to monitor moisture in the soil as a function of well depth, which could be indicative of tank leakage. The routine gross gamma logging data were stored electronically from 1974 through 1994. The routine gross gamma logging program ended in 1994. A program was initiated in 1995 to log each of the available drywells in each tank farm with a spectral gamma logging system. The spectral gamma logging system provides quantitative values for gamma-emitting radionuclides. The baseline spectral gamma logging database is available electronically.

Repeat spectral drywell scans are not part of the established Tank Farm leak detection program, but they can be run on request if special needs arise. A select subset of drywells is routinely monitored by the Vadose Zone Characterization Project to assess movement of gamma-emitting radionuclides in the subsurface.

### Laterals

Laterals are horizontal drywells positioned under single-shell waste storage tanks to detect radionuclides in the soil which could be indicative of tank leakage. These drywells can be monitored by radiation detection probes. Laterals are 4-inch inside diameter steel pipes located 8 to 10 feet below the tank's concrete base.

There are three laterals per tank. Laterals are located only in A and SX farms. There are currently no functioning laterals and no plan to prepare them for use.

#### Surface Levels

The surface level measurements in all waste storage tanks are monitored by manual or automatic conductivity probes, and recorded and transmitted or entered into the Surveillance Analysis Computer System.

#### Automatic FIC

An automatic waste surface level measurement device is manufactured by the Food Instrument Corporation (FIC). The instrument consists of a conductivity electrode (plummet) connected to a calibrated steel tape, a steel tape reel housing and a controller that automatically raises and lowers the plummet to obtain a waste surface level reading. The controller can provide a digital display of the data and until February 1999, the majority of the FICs transmitted readings to the Computer Automated Computer Surveillance System (CASS). Since CASS retirement, all FIC gauges are read manually. FICs are being replaced by ENRAF detectors (see below).

#### ENRAF 854 ATG Level Detector

FICs and some manual tapes are in the process of being replaced by the ENRAF ATG 854 level detector. The ENRAF gauge, fabricated by ENRAF Incorporated, determines waste level by detecting variations in the weight of a displacer suspended in the tank waste. The displacer is connected to a wire wound onto a precision measuring drum. A change in the waste level causes a change in the weight of the displacer which will be detected by the force transducer. Electronics within the gauge causes the servo motor to adjust the position of the displacer and compute the tank level based on the new position of the displacer drum. The gauge displays the level in decimal inches. The first few ENRAFs that received remote reading capability transmit liquid level data via analog output to the TMACS. The remaining ENRAFs and future installations will transmit digital level data to TMACS via an ENRAF Computer Interface Unit (CIU). The CIU allows fully remote communication with the gauge, minimizing tank farm entry.

#### Annulus

The annulus is the space between the inner and outer shells on DSTs only. Drain channels in the insulating and/or supporting concrete carry any leakage to the annulus space where conductivity probes are installed. The annulus conductivity probes and radiation detectors are the primary means of leak detection for all DSTs.

#### Liquid Observation Well (LOW)

In-tank liquid observation wells are used for monitoring the ILL in single-shell tanks. The wells are usually constructed of fiberglass or TEFZEL-reinforced epoxy-polyester resin (TEFZEL is a trademark of E. I. du Pont de Nemours & Company). There are a few LOWs constructed of steel. LOWs are sized to extend to within 1 inch of the bottom of the waste tank, are sealed at their bottom ends, and have a nominal outside diameter of 3.5 inches. Gamma and neutron probes are used to monitor changes in the ILL, and can indicate intrusions or leakage by increases or decreases in the ILL. There are 70 LOWs installed in SSTs that contain or are capable of containing greater than 50 Kgallons of drainable interstitial liquid. All of the LOWs are monitored weekly with the exception of TX-108 which is monitored by request only. Two LOWs installed in DSTs SY-102 and AW-103 are used for special, rather than routine, surveillance purposes only.

#### Thermocouple (TC)

A thermocouple is a thermoelectric device used to measure temperature. More than one thermocouple element on a device (probe) is called a thermocouple tree. In DSTs there may be one or more thermocouple trees in risers in the primary tank. In addition, in DSTs only, there are TC elements installed in the insulating concrete, the lower primary tank knuckle, the secondary tank concrete foundation, and in the outer structural concrete.

These monitor temperature gradients within the concrete walls, bottom of the tank, and the domes. In SSTs, one or more thermocouples may be installed directly in a tank, although some SSTs do not have any trees

installed. A single TC element may be installed in a riser or lowered down an existing riser or LOW. There are also four thermocouple laterals beneath tank 105-A in which temperature readings are taken in 34 TC elements.

In-tank Photographs and Videos

In-tank photographs and videos may be taken to aid in resolving in-tank measurement anomalies and determine tank integrity. Photographs and videos help determine sludge and liquid levels by visual examination.

ACRONYMS - Waste Type acronyms begin on Page D-2

<u>BBI</u>	Best Basis Inventory
<u>CCS</u>	Controlled, Clean, and Stable (tank farms)
<u>CH2M HILL</u>	CH2M HILL Hanford Group, Inc.
<u>DCRT</u>	Double-Contained Receiver Tank

Additional definitions (used in the SST Inventory columns) follow: (IL, DIL, DLR, PLR, etc.)

2. INVENTORY AND STATUS BY TANK – COLUMN VOLUME CALCULATIONS AND DEFINITIONS FOR TABLE B-1 (Single-Shell Tanks only)

COLUMN HEADING	COLUMN VOLUME CALCULATIONS (Underlined)/DEFINITIONS
Total Waste	<u>Solids volume plus Supernatant Liquid.</u> Solids include sludge and saltcake (see definitions below).
Supernatant Liquid (1)	<u>May be either measured or estimated.</u> Supernatant is either the estimated or measured liquid floating on the surface of the waste or under a floating solids crust. In-tank photographs or videos are useful in estimating the liquid volumes; liquid floating on solids and core sample data are useful in estimating large liquid pools under a floating crust.
Drainable Interstitial Liquid (DIL) (1)	<u>This is initially calculated.</u> Drainable interstitial liquid is calculated based on the saltcake and sludge volumes, using calculated porosity values from past pumping or actual data for each tank. Interstitial liquid is liquid that fills the interstitial spaces of the solids waste. The sum of the interstitial liquid contained in saltcake and sludge minus an adjustment for capillary height is the initial volume of drainable interstitial liquid.
Pumped This Month	<u>Net total gallons of liquid pumped from the tank during the month.</u> If supernatant is present, pump production is first subtracted from the supernatant volume. The remainder is then subtracted from the drainable interstitial liquid volume.
Total Pumped (1)	<u>Cumulative net total gallons of liquid pumped from 1979 to date.</u>
Drainable Liquid Remaining (DLR) (1)	<u>Supernatant plus Drainable Interstitial Liquid.</u> The total Drainable Liquid Remaining is the sum of drainable interstitial liquid and supernatant.
Pumpable Liquid Remaining (PLR) (1)	<u>Drainable Liquid Remaining minus unpumpable volume.</u> Not all drainable interstitial liquid is pumpable.
Sludge	<u>Solids formed during sodium hydroxide additions to waste.</u> Sludge was usually in the form of suspended solids when the waste was originally received in the tank from the waste generator. In-tank photographs or videos may be used to estimate the volume.
Saltcake	<u>Results from crystallization and precipitation after concentration of liquid waste, usually in an evaporator.</u> If saltcake is layered over sludge, it is only possible to measure total solids volume. In-tank photographs or videos may be used to estimate the saltcake volume.
Solids Volume Update	<u>Indicates the latest update of any change in the solids volume.</u>

COLUMN HEADING	COLUMN VOLUME CALCULATIONS ( <u>Underlined</u> )/DEFINITIONS
Solids Update Source - See Footnote	<u>Indicates the source or basis of the latest solids volume update.</u>
Last In-Tank Photo	<u>Date of last in-tank photographs taken.</u>
Last In-Tank Video	<u>Date of last in-tank video taken.</u>
See Footnotes for These Changes	<u>Indicates any change made the previous month.</u> A footnote explanation for the change follows the Inventory and Status by Tank Appendix (Table B-1).

(1) Volumes for supernatant, DIL, DLR, and PLR are not shown in these columns until interim stabilization is completed. Total gallons pumped, total waste, sludge, and saltcake volumes are shown and adjusted based on actual pumping volumes.
