Mr. Jeff Lerch, T6-08  
Westinghouse Hanford Company  
P.O. Box 1970  
Richland, Washington 99352

Dear Jeff:

TRANSMITTAL OF 200-BP-1 GROUNDWATER ANALYSIS PROJECT, TASK 7 DATA PACKAGE/REPORT NO. 1, REVISION 0, MAY 1, 1991 AND TASK 7 DATA PACKAGE/REPORT NO. 2 & 3, REVISION 0, MAY 8, 1991

Enclosed are three copies of the subject 200-BP-1 Task 7 Data Package/Report No. 2 & 3. This is also to document the transmittal of three copies of Task 7 Data Package/Report No. 1 on May 3, 1991. A cover letter was not furnished with the transmittal.

If you have any questions after reviewing the data, please give me a call on 376-5802.

Sincerely,

*B. M. Gillespie*

B. M. Gillespie  
Analytical Laboratory Operations  
200-BP-1 PNL Project Manager

## INTRODUCTION

This data package contains the results obtained by Pacific Northwest Laboratory (PNL) staff in the characterization of samples for the 200-BP-1 Groundwater Analysis Project. The samples were submitted for analysis by Westinghouse Hanford Company (WHC) under the Technical Project Plan (TPP) 16772 and the Quality Assurance Project Plan (QAPjP) ALO-001. The samples are all ground water collected in support of Task 7. The analytical procedures required for analysis were defined in the Test Instructions (TI) prepared by the PNL 200-BP-1 Project Management Office in accordance with the TPP and the QAPjP ALO-001.

The samples (Table 1) were submitted with the appropriate WHC Chain of Custody (COC) and Sample Analysis Request Forms. The samples were delivered at refrigerated temperature to the 300 Area, 325 Building and 314 Building 200-BP-1 Sample Custodians.

The requested analyses for these samples were cyanide, free cyanide and ferrocyanide. A complex cyanide result is determined by the difference of the total cyanide and the free cyanide results. A "ferrocyanide" result is not obtained nor calculated since the amount of the complex cyanide being ferrocyanide is indeterminant. Sample 90-7074 was submitted for Ru-106 analysis and the results will be reported in a separate data package for all Ru-106 sample data results for this task. The quality control (QC) requirements for each sample are defined in the test instructions for each sample. The QC requirements outlined in the procedures and requested in the WHC SOW were followed. Sample duplicates, methods blank, matrix spikes and laboratory control standards were analyzed. All QC data that exist are included in this Data Package/Report.

The data in this package are reported in separate tables (Tables 2 through 4) for each analyte or method. Three appendices are provided; one for Test Instruction, one for Chain of Custody, Sample Analysis Request Forms and Sample Receipt Forms and one that contains the primary inorganic analytical data.

CERTIFICATION STATEMENT

I certify that this data package is in compliance with the terms and conditions of the TPP 16772 and QAPjP ALO-001 for completeness. Release of the data contained in this hard copy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Project Manager or the Project Manager's designee, as verified by the following signature.

Date

CYANIDE ANALYSIS RESULTS

Total cyanide analysis was performed in room 419 of building 325 in the 300 area. Results for Task 7 work package #1 are presented by colorimetric analysis set in Table 1.

Free cyanide analysis was only required on sample 90-7074. All other samples in this data package had total cyanide concentrations of less than 20 ug/L, except for sample 90-7067. The test instructions for sample 90-7067 did not require free cyanide analysis where the total cyanide was less than or equal to 2 ppm (TI-200-1-28). This limit was the limit for Task 6 cyanide analysis and was reevaluated for later Task 7 samples and found to be too high. The limit was reset at 20 ug/L. This sample has been submitted for Free CN results.

Sample results for sample and duplicate were below the CRDL of 10 ug/L except for samples 90-7067, 90-7071, 90-7079, 90-7074 and 90-7075. Duplicate precision was within the accepted limit for all samples except 90-7067 (defined in the CLP manual as one CRDL where the sample or duplicate value was below five times the CRDL). Results for this sample are suspect due to an inability to meet hold times because of a failure of laboratory support facilities. In this case we experienced a loss of the initial sample when a loss of house vacuum occurred during the distillation run. Vacuum line failure was traced to clogging of the line by Protactinium sludge, described in LRB 54026 pages 24-26. The reported 90-7067 and 90-7068 results are from a split of the sample obtained from Karl Pool and ran on 3/25/91. While sample values, not sample duplicate values should be taken for calculation of total cyanide, for the case of 90-7067 the duplicate may be better. This suggestion is based on obtaining a 98% spike recovery for sample + spike if the duplicate sample is used for %recovery calculations.

The 12 day hold time specified for cyanide analysis under the CLP protocol was met except for samples 90-7067, 90-7068, 90-7069, 90-7070 and 90-7071. The hold time was missed by one day for samples 90-7069, 90-7070 and 90-7071. Justification for missing hold times for samples 90-7067 and 90-7068 are described in the previous paragraph.

Sample 90-7079 distillation and analysis was repeated on March 8, 1991 due to poor initial calibration verification (ICV) and spike recovery on March 6, 1991. This latter analysis had a spike recovery of 105.7% and ICV recovery of 121%.

We changed our sample analysis group size from 6 sample/run to 2 sample/run during this initial data package #1 of Task 7 cyanide analysis program. The only samples to be reported in a group of 6/run are 90-7079, 90-7075, 90-7076, 90-7077 and 90-7078. As the latter four samples had an acceptable distillation ICV recovery of 99.7% these samples were not rerun like sample 90-7079.

Average spiked sample cyanide recovery was  $96\% \pm 29\%$ . This average recovery is  $90\% \pm 9\%$  if the duplicate results is used for sample 90-7067 to determine the sample + spike recovery (see above). Recovery of cyanide for laboratory control samples was 103.4% for liquid standard ICV-6. Recovery value for ICV-6 is based on the spiking of 1 mL of stock standard ICV-6 to 500mL of deionized water and recovery back calculated to the original ICV-6 cyanide concentration. Cyanide found in blank was below stated IDL.

FREE CYANIDE ANALYSIS RESULTS

The sample solutions were analyzed by direct injection into an ion chromatograph/amperometric detector instrument system according to procedure PNL-ALO-271, "Procedure for Analysis of Free Cyanide in Water and Solid Sample Leachates" in the 314 building in the 300 area.

The analysis of free cyanide in water samples was to be performed on samples whose total cyanide content was found to be greater than 20 g CN/L. Free cyanide analysis was done for a few samples that were nearing hold time requirements even though Total Cyanide results were not available and subsequently found to be below 20 g CN/L.

Chromatograms for samples found to have near zero Free Cyanide content, revealed a disturbing "negative peak" interference in the cyanide region. The analyst believes this interference can be eliminated or at least greatly reduced by a relatively minor adjustment of the chromatographic eluent composition. Such adjustment has not been tried to date but will be as time and resources become available. One of the samples with essentially zero free cyanide content (90-7073) which displayed the largest "negative peak" interference of all the samples in this set, was used to evaluate spike recovery. When spiked at nominal 10 ppb CN<sup>-</sup> level, the spike recovery was found to be only 71% (flagged with "N"). Duplicate spikes at nominal 20 ppb CN<sup>-</sup>, revealed 86 and 83% recoveries.

Upon review of this data set, the average spike recovery was 80% with a standard deviation of 8% and the average recovery of the standards was 98.5% with a standard deviation of 1.4%. Thus, the method precision and bias observed for free cyanide analysis during the analytical session involving these samples meets the client requirements.

The CLP defined hold times of 12 days from receipt was met for all samples reported to date.

 N = Spiked sample recovery not within control limits

COMPLEX CYANIDE RESULTS

The complex cyanide results are calculated from the difference in the total cyanide results and the free cyanide results. A "ferrocyanide" result is not obtained nor calculated since the amount of the complex cyanide being ferrocyanide is indeterminate.

Samples are analyzed for free cyanide based on first determining that the total cyanide results is greater than 20 ug/L. Samples below 20 ug/L total cyanide are typically not analyzed for free cyanide to save on analysis cost. Attempting to perform free cyanide analysis near the Contract Required Detection Limit of total cyanide is not meaningful.

In this data set, there were only two samples (90-7067 & 90-7074) requiring free cyanide determination. One of the samples has not been analyzed for free cyanide content yet. Initial determination of total cyanide for this sample, 90-7067, was assumed to be <20ug/L which later was found to be a poor analysis set. This sample, along with 90-7068, were reanalyzed at a later date due to building vacuum malfunction. The sample has been submitted for free cyanide analysis. The results will be submitted at a later date for incorporation into this data report. The other samples analyzed for free cyanides were analyzed because they were nearing the hold time limit.

TABLE 4: COMPLEX CYANIDE DETERMINATION

Sample ID#	Total CN Sample ug/L	Free CN Sample ug/L	Complex CN Sample ug/L (1)
90-7067	30.5	(2)	
90-7074	385.2	298	87.0
90-7075	13.9	22.5	0 (3)

- (1) Results calculated by subtracting the Free cyanide results from the Total cyanide results.
- (2) Sample results not obtained to date. Will be submitted at a later date.
- (3) The results is 0 as the total cyanide and free cyanide results are near the CRDL of both analytes.

## INTRODUCTION

This data package contains the results obtained by Pacific Northwest Laboratory (PNL) staff in the characterization of samples for the 200-BP-1 Groundwater Analysis Project. The samples were submitted for analysis by Westinghouse Hanford Company (WHC) under the Technical Project Plan (TPP) 16772 and the Quality Assurance Project Plan (QAPjP) ALO-001. The samples are all ground water collected in support of Task 7. The analytical procedures required for analysis were defined in the Test Instructions (TI) prepared by the PNL 200-BP-1 Project Management Office in accordance with the TPP and the QAPjP ALO-001.

The samples (Table 1) were submitted with the appropriate WHC Chain of Custody (COC) and Sample Analysis Request Forms. The samples were delivered to the 300 Area, 329 Building 200-BP-1 Sample Custodian.

The requested analysis for these samples was for Ru-106. The quality control (QC) requirements for each sample are defined in the test instructions for each sample. The QC requirements outlined in the procedures and requested in the WHC SOW were followed. A methods blank, methods spike and methods spike duplicate were analyzed. All QC data that exist are included in this Data Package/Report.

Three appendices are provided; one for Test Instruction, one for Chain of Custody, Sample Analysis Request Forms and Sample Receipt Forms and one that contains the primary radiochemistry analytical data.

CERTIFICATION STATEMENT

I certify that this data package is in compliance with the terms and conditions of the TPP 16772 and QAPjP ALO-001 for completeness. Release of the data contained in this hard copy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Project Manager or the Project Manager's designee, as verified by the following signature.

**Ru-106 Analysis in Groundwaters for  
Task 7 of the 200 BP-1 Site Investigation**

**Discussion of Procedure and Results**

Twelve groundwater samples were received for analysis of Ru-106 under Task 7. These samples were analyzed according to PNL-ALO-471, "Determination of Low Concentration of Ru-106 in Groundwater by Direct Counting on Dual Large Sodium Iodide Detectors with Coincidence/Anticoincidence Multidimensional Analysis." A Methods blank was added to the sample set consisting of 3.5 L of ultrapure water sealed in the sample geometry of a large Tupperware pie container. In all cases, the samples were counted in new Tupperware Pie containers. Because of the large volume of sample analyzed (3.5 L), there was not enough liquid left to perform sample duplicate analysis. The Test Instruction indicates that field duplicates would be required if duplicate samples analysis were required. No field duplicates were received. A Methods spike and Methods spike duplicate were analyzed consisting of an aliquot of Ru-106 in 3.5 L of ultrapure water in a Tupperware pie container. All work was performed according to the Test Instruction received that covers these samples.

The samples were prepared for counting by taring a "NEW" Tupperware pie container and then adding exactly 3.500 Kg of sample (or ultrapure water). The container was then sealed with tape to help prevent leakage and then sealed in a heavy polyethylene bag. This bag was then put inside another plastic bag until the sample was counted. This work followed PNL-ALO-471. A Methods blank, Methods blank spike, and Methods blank spike duplicate were also prepared in a similar manner.

The samples were then analyzed by direct counting of the samples between two large sodium iodide detectors using coincidence/anticoincidence multidimensional analysis. Spectral data was acquired directly into a PC and the data was stored on a floppy. The data was analyzed according to the procedure described in PNL-ALO-471. The activity observed for Ru-106 in the samples is listed in Table 2. Five samples were counted twice as a check on sample reproducibility. No detectable activity of Ru-106 was observed in the

samples or blank that were counted, therefore, a lower limit of detection (LLD) value was reported. Sample 90-7074-L-1 presented the greatest analytical problem because of the presence of 374 pCi of  $^{60}\text{Co}$ . The Compton from the full energy peaks of  $^{60}\text{Co}$  present an interference that must be corrected for.

Instrument check sources (controls) were counted intermittently over the period of time the samples were counted. The Control Procedure, PNL-ALO-470, was followed.

A Methods blank, 90-7074-L-5, was used to calculate the detection limit for Ru-106 which was determined to be  $<1.1$  pCi/L. This lower limit of detection (LLD) was determined using the method described in HASL-300 to calculate a LLD with 95% confidence. The Target Detection Limit given in QAPjP ALO-001, Rev 1, is 3 pCi/L with 95% confidence.

A Methods spike (90-7074-L-3) and Methods spike duplicate (90-7074-L-6) were also counted. The known value of Ru-106 in both samples is  $5890 \pm 200$  pCi and the determined values were  $5890 \pm 60$  and  $5890 \pm 40$  pCi, respectively. The errors reported are 2 sigma counting errors. The Target accuracy and precision is  $\pm 25\%$ . This data is well within the required range for accuracy and precision.

Table 2: Ru-106 Activity in Groundwater Samples for Task 7

Sample Set 1

MDA Detector 9

GROUNDWATER ANALYSIS PROJECT**

**TASK 7**

**DATA PACKAGE/REPORT No. 4 & 5**

**Revision 0**

**June 3, 1991**

**Prepared by: B.M. Gillespie**

**Pacific Northwest Laboratory**

**(PNL Project #16772)**

## INTRODUCTION

This data package contains the results obtained by Pacific Northwest Laboratory (PNL) staff in the characterization of samples for the 200-BP-1 Groundwater Analysis Project. The samples were submitted for analysis by Westinghouse Hanford Company (WHC) under the Technical Project Plan (TPP) 16772 and the Quality Assurance Project Plan (QAPjP) ALO-001. The samples are all ground water collected in support of Task 7. The analytical procedures required for analysis were defined in the Test Instructions (TI) prepared by the PNL 200-BP-1 Project Management Office in accordance with the TPP and the QAPjP ALO-001.

The samples (Table 1) were submitted with the appropriate WHC Chain of Custody (COC) and Sample Analysis Request Forms. The samples were delivered at refrigerated temperature to the 300 Area, 325 Building and 314 Building 200-BP-1 Sample Custodians.

The requested analyses for these samples were cyanide, free cyanide and ferrocyanide. A complex cyanide result is determined by the difference of the total cyanide and the free cyanide results. A "ferrocyanide" result is not obtained nor calculated since the amount of the complex cyanide being ferrocyanide is indeterminate. Samples 91-2707, 91-2708, 91-2709, 91-2710, 91-2711, 91-2780, 91-2781, 91-2859, 91-2860, and 91-2962 were submitted for Ru-106 analysis and the results will be reported in a separate data package for all Ru-106 sample data for this task. The quality control (QC) requirements for each sample are defined in the test instructions for each sample. The QC requirements outlined in the procedures and requested in the WHC SOW were followed. Sample duplicates, methods blank, matrix spikes and laboratory control standards were analyzed. All QC data that exist are included in this Data Package/Report.

The data in this package are reported in separate tables (Tables 2 through 4) for each analyte or method. Three appendices are provided; one for Test Instruction, one for Chain of Custody, Sample Analysis Request Forms and Sample Receipt Forms and one that contains the primary inorganic analytical data.

CERTIFICATION STATEMENT

I certify that this data package is in compliance with the terms and conditions of the TPP 16772 and QAPjP ALO-001 for completeness. Release of the data contained in this hard copy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Project Manager or the Project Manager's designee, as verified by the following signature.

CYANIDE ANALYSIS RESULTS FOR SAMPLE DELIVERY GROUP #4

Cyanide analysis was performed in room 419 of building 325 in the Hanford Site 300 area. The analytical method used to acquire data for this data package was PNL-ALO-270; a distillation/colorimetric analysis referenced to a plot of cyanide standard concentration vs absorbance. Data package total cyanide results are summarized in Table 2.

Sample results for sample and duplicate were below the instrument detection limit (IDL) of 5.9  $\mu\text{g/L}$  except for samples 91-2707, 91-2711, 91-2780, 91-2781 and 91-2859. Duplicate precision was within the accepted limit for all samples. Cyanide concentrations were above the IDL and below the CRDL (10  $\mu\text{g/L}$ ) for samples 91-2707 and 91-2711, which had CN concentrations of 9.2 and 7.4  $\mu\text{g/L}$ , respectively. Samples 91-2780, 91-2781 and 91-2859 had cyanide concentrations of 12.3, 11.6 and 14.7  $\mu\text{g/L}$ , respectively. Free cyanide analysis was not done as samples must have a total cyanide concentrations of greater than 20  $\mu\text{g/L}$  before free cyanide analysis is required.

The 12 day hold time specified for cyanide analysis under the CLP protocol was met for all samples in this work package.

Average spiked sample cyanide recovery was 102.1% with a standard deviation of 2.1%. We chose to calculate the spike recovery for Task 7 by subtracting the sample cyanide concentration from the sample + spike concentration. This is a deviation from the CLP protocol which calls for correcting the sample + spike concentration for just those samples where the sample concentration was above the IDL. This deviation was implemented to avoid biasing the cyanide recovery by the high IDL values we obtained in our quarterly IDL study. We thus prevented the reporting of high spike recovery values obtained where cyanide concentrations were detectable in the sample but were below the arbitrary IDL.

Recovery of cyanide for initial calibration verification sample [ICV-6 (0789), ICF Technology Inc., Consensus value 9.4 mg/L] was 109.3% with a standard deviation of 4.5%. Recovery value for ICV-6 is based on the spiking of 1 mL of stock standard ICV-6 to 500 mL of deionized water and recovery back

9613477.2727

calculated to the original ICV-6 cyanide concentration. Cyanide found in blanks analyzed in the work package were below the stated IDL.

CYANIDE ANALYSIS RESULTS FOR SAMPLE DELIVERY GROUP #5

Cyanide analysis was performed in room 419 of building 325 in the Hanford Site 300 area. The analytical method used to acquire the data for this data package was PNL-ALO-270; a distillation/colorimetric analysis referenced to a plot of cyanide standard concentration vs absorbance. Data package total cyanide results are summarized in Table 3.

Sample results for sample and duplicate were below the instrument detection limit (IDL) of 5.9  $\mu\text{g/L}$  for all samples. Free cyanide analysis was not done as samples must have a total cyanide concentrations of greater than 20  $\mu\text{g/L}$  before free cyanide analysis is required.

The 12 day hold time specified for cyanide analysis under the CLP protocol was met for all samples in this work package.

Average spiked sample cyanide recovery was 98.1% with a standard deviation of 3.2%. We chose to calculate the spike recovery for Task 7 by subtracting the sample cyanide concentration from the sample + spike concentration. This is a deviation from the CLP protocol which calls for correcting the sample + spike concentration for just those samples where the sample concentration was above the IDL. This deviation was implemented to avoid biasing the cyanide recovery by the high IDL values we obtained in our quarterly IDL study. We thus prevented the reporting of high spike recovery values obtained where cyanide concentrations were detectable in the sample but were below the arbitrary IDL.

Recovery of cyanide for initial calibration verification sample [ICV-6 (0789), ICF Technology Inc., Consensus value 9.4 mg/L] was 107.2% with a standard deviation of 4.0%. Recovery value for ICV-6 is based on the spiking of 1 mL of stock standard ICV-6 to 500 mL of deionized water and recovery back calculated to the original ICV-6 cyanide concentration. Cyanide found in blanks analyzed in the work package were below the stated IDL.

GROUNDWATER ANALYSIS PROJECT**

**TASK 7**

**DATA PACKAGE/REPORT No. 2 & 3**

**Revision 0**

**May 8, 1991**

**Prepared by: B.M. Gillespie**

**Pacific Northwest Laboratory**

**(PNL Project #16772)**

## INTRODUCTION

This data package contains the results obtained by Pacific Northwest Laboratory (PNL) staff in the characterization of samples for the 200-BP-1 Groundwater Analysis Project. The samples were submitted for analysis by Westinghouse Hanford Company (WHC) under the Technical Project Plan (TPP) 16772 and the Quality Assurance Project Plan (QAPjP) ALO-001. The samples are all ground water collected in support of Task 7. The twenty one samples from sample delivery group number two and the two samples from sample delivery group number three are reported together in this one data report/package to save on preparation costs of a separate package for set three. The analytical procedures required for analysis were defined in the Test Instructions (TI) prepared by the PNL 200-BP-1 Project Management Office in accordance with the TPP and the QAPjP ALO-001.

The samples (Table 1) were submitted with the appropriate WHC Chain of Custody (COC) and Sample Analysis Request Forms. The samples were delivered at refrigerated temperature to the 300 Area, 325 Building and 314 Building 200-BP-1 Sample Custodians.

The requested analyses for these samples were cyanide, free cyanide and ferrocyanide. A complex cyanide result is determined by the difference of the total cyanide and the free cyanide results. A "ferrocyanide" result is not obtained nor calculated since the amount of the complex cyanide being ferrocyanide is indeterminant. Samples 90-7082 and 91-1825 were submitted for Ru-106 analysis and the results will be reported in a separate data package for all Ru-106 sample data results for this task. The quality control (QC) requirements for each sample are defined in the test instructions for each sample. The QC requirements outlined in the procedures and requested in the WHC SOW were followed. Sample duplicates, methods blank, matrix spikes and laboratory control standards were analyzed. All QC data that exist are included in this Data Package/Report.

The data in this package are reported in separate tables (Tables 2 through 4) for each analyte or method. Three appendices are provided; one for Test Instruction, one for Chain of Custody, Sample Analysis Request Forms and

9613477.2788

Sample Receipt Forms and one that contains the primary inorganic analytical data.

CERTIFICATION STATEMENT

I certify that this data package is in compliance with the terms and conditions of the TPP 16772 and QAPjP ALO-001 for completeness. Release of the data contained in this hard copy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Project Manager or the Project Manager's designee, as verified by the following signature.

## CYANIDE ANALYSIS RESULTS

Cyanide analysis was performed in room 419 of building 325 in the Hanford Site 300 area. Results for Task 7 data packages #2 and #3 are presented by colorimetric analysis run accompanied by a plot of cyanide standard concentration vs absorbance for that analysis run. Data package #2 and #3 results are summarized in Table 2.

Sample results for sample and duplicate were below the instrument detection limit (IDL) of 5.9  $\mu\text{g/L}$  except for samples 91-2399 and 90-7082. Duplicate precision was within the accepted limit for all samples. Sample 91-2399 had a cyanide concentration of 6.3  $\mu\text{g/L}$  and sample 90-7082 had a value of 17.8  $\mu\text{g/L}$ . Free cyanide analysis was not done as samples must have a total cyanide concentration of greater than 20  $\mu\text{g/L}$  before free cyanide analysis is required.

The 12 day hold time specified for cyanide analysis under the CLP protocol was met for all samples in this work package.

Average spiked sample cyanide recovery was 99.6% with a standard deviation of 3.8%. We chose to calculate the spike recovery for task 7 by subtracting the sample cyanide concentration from the sample + spike concentration. This is a deviation from the CLP protocol which calls for correcting the sample + spike concentration for just those samples where the sample concentration was above the IDL. This deviation was implemented to avoid biasing the cyanide recovery by the high IDL values we obtained in our quarterly IDL study. We thus prevented the reporting of high spike recovery values obtained where cyanide concentrations were detectable in the sample but were below the arbitrary IDL.

Recovery of cyanide for initial calibration verification sample (ICV-6) was 105.9% with a standard deviation of 5.6%. Recovery value for ICV-6 is based on the spiking of 1 mL of stock standard ICV-6 to 500 mL of deionized water and recovery back calculated to the original ICV-6 cyanide concentration. Cyanide found in blanks analyzed in the work package were below the stated IDL.

1. Concentration of stock ICV-6 = 9.4 mg/L (In actual practice 9.4 ug of cyanide is added to each distillation flask and recovered in 250 mL of NaOH).
2. Concentration of spike added = 90.6 ug/L.
3. Contract required detection limit for water = 10 ug/L.
4. Used 250 mL of sample per distillation due to limited sample size of 1.5L of total sample.
5. Duplicate precision under the CLP protocol must be within one CRDL when either sample or duplicate are below 5X CRDL.
6. Sample 90-7067 and 90-7079 not part of data set #2 of task 7.

CLP Flags

- U = Analyzed but not detected (ICL or less than IDL)
- N = Spiked sample recovery not within control limits
- \* = Duplicate analysis not within control limits

90-7079-2092  
 90-7079-2092  
 90-7079-2092

FREE CYANIDE ANALYSIS RESULTS

Free cyanide analysis was not done as samples must have a total cyanide concentrations of greater than 20  $\mu\text{g/L}$  before free cyanide analysis is required.

Table 3: Free Cyanide Analysis Data

NO DATA REQUIRED

COMPLEX CYANIDE RESULTS

Complex cyanide can not be determined from the existing total cyanide data as no free cyanide results were required.

SAMPLE RECEIPT FORM

Delivered by: Dusty Butcher Date/Time: \_\_\_\_\_

Received by: Karl H. Pool

Customer Sample Number(s): B00F46 B00F49

ALO Sample Number(s): 91-1787 91-1788

1. Customer Chain-of-Custody Form: Present  Absent \_\_\_\_\_

2. Additional Shipping Forms (list):

3. Custody Seals on Shipping and/or Sample Containers and their Conditions.

Present  Absent \_\_\_\_\_

If Present, Condition: Intact

4. Sample Tag(s) ID Numbers if not Recorded on the Chain-of-Custody Record or on Sample Vial.

Notes:

5. Condition of Shipping Container (i.e., broken container, dented, breached plastic bag, temperature of sample container as defined in Section 3.0 in PNL-ALO-051, etc.) Good condition T= 4.0°C

6. Condition of Sample Vials.

7. Verification of Agreement or Nonagreement of Information on Receiving Documents.

8. Resolution of Problems or Discrepancies.

RETURN COMPLETED FORM TO PROJECT MANAGER

SAMPLE RECEIPT FORM

Delivered by: DUSTY BUTCHER Date/Time: 3/5/91 1420

Received by: J. ROBBINS

Customer Sample Number(s): B00F46 B00F49

ALO Sample Number(s): 91-1787 91-1788

1. Customer Chain-of-Custody Form: Present  Absent \_\_\_\_\_

Subject: Deliverable for 200-BP-1 Data Validation, Task Order S-92-19 Rev. D, WHC  
Contract No. MLW-SVV-073750

Dear Mr. Buckmaster:

Enclosed is the subject deliverable required by the referenced SAIC Task Order and WHC contract. Included in this deliverable, please find a copy of the Data Validation Summary Report for Data Package BOOIF01-PNL-033. This deliverable was prepared by Golder Associates with support from Tom Clark of SAIC under the direction of Kent M. Angelos.

Should you have any questions, please do not hesitate to contact the following: Mr. Kent Angelos of Golder Associates at (206) 883-0777, Michael Hoxie or myself at (509) 943-3133.

Sincerely yours,

SCIENCE APPLICATIONS INTERNATIONAL CORPORATION

## 1. INTRODUCTION

This report presents the results of data validation on data package B00F01-PNL-033. The samples contained in this data package were analyzed for ruthenium-106 (Ru-106) by the Battelle-Pacific Northwest Laboratories of Richland, Washington.

The table presented below provides a cross reference list of sample delivery group (SDG) numbers, HEIS numbers and laboratory sample identification numbers.

SDG	HEIS No.	LAB No.
B00F01-PNL-033	B00F01	90-7074
	B00F11	90-7082
	B00FF7	91-1825
	B00FB3	91-2707
	B00F93	91-2708
	B00FB0	91-2709
	B00F54	91-2710
	B00FD0	91-2711
	B00F90	91-2781
	B00FB6	91-2859
	B00FC4	91-2860
	B00FG4	91-2862

Data validation was conducted in accordance with the Westinghouse Hanford Company statement of work (WHC 1991), validation procedures (WHC 1992) and the laboratory technical procedure, PNL-ALO-471 (PNL 1991). Data verification was conducted by comparison of the reported results against the raw data and laboratory worksheets provided in the data packages, discrepancies noted were corrected on the laboratory report forms provided in Appendix A. Sample results and lower limit of detection (LLD) values were calculated using computer spreadsheet models based on the formulae provided in the laboratory procedure. Printouts of the spreadsheet data are provided in Appendix B along with a description of the formulae used for recalculation. Data validation was documented using a checklist prepared according to the requirements listed in the validation procedures (WHC 1992). Copies of the checklists are provided in Appendix C.

Qualifiers assigned to the sample data as a result of the validation are explained below:

- U The constituent was analyzed for, but was not detected above the Lower Limit of Detection (LLD).
- UJ The constituent was analyzed for, but its absence (non-detection) is estimated and may be inaccurate or imprecise.
- UR The constituent was analyzed for but was not detected above the Lower Limit of Detection. The associated result is conditionally rejected pending submittal of

additional information.

- J The associated value is an estimated quantity and may not represent the amount actually present in the sample.
- R The associated value is unusable due to a major deficiency identified during validation.
- R\* The constituent was analyzed for and detected. The associated result is conditionally rejected pending submittal of additional information.

Abbreviations used in the laboratory data summary tables and calculation spreadsheets are summarized below.

- NR Not reported by the laboratory.
- NA Not applicable.

## 2. DATA QUALITY OBJECTIVES

This section provides a summary of data quality indicators as compared to the work plan data quality objectives.

### 2.1 Detection Limits

Work plan detection limit goals were met for all samples and analytical parameters with the exception of the results listed in the table below.

ANALYSIS	SAMPLES	DETECTION LIMIT GOAL	CALCULATED LLD
Ruthenium-106	B00F01	3 pCi/L	4.6
	B00FB3		3.1
	B00FB6		3.5

### 2.2 Accuracy

Two replicate blank spike samples were analyzed as part of this data package and were used as detector control samples (PNL Nos. 90-7074-L-3 and 90-7074-L-6). The percent recoveries for both samples was 100%. No other spike samples were analyzed as part of this data set, therefore the spike recoveries may not represent recovery of Ru-106 from the sample matrix.

### 2.3 Precision

Two blank spike samples and one set of field duplicate samples (HEIS Nos. B00FC4 and B00FG4) were analyzed as part of this data set. Precision of the blank spike samples as relative percent difference (RPD) was 0. Ru-106 was not detected in the field duplicate

samples therefore no RPD value could be determined.

#### 2.4 Field Blanks

No field blanks were analyzed for this sample set for evaluation.

### 3. COMPLETENESS

The data package was complete for all necessary items required for validation with the exception of the items outlined in the sections below.

### 4. CALIBRATION

Calibration data was reported for the detector control samples only (blank spikes), as discussed in section 2.2. In addition, a series of check source analyses were reported for cesium-137 and cobalt-60 analyses only. No other check source analyses were conducted for ruthenium-106. Since all reported calibration analyses were within the laboratory control limits and the detector calibration requirements specified in the technical procedure were followed, no qualification is necessary.

### 5. BLANKS

Method blanks were not analyzed as part of this sample set, however no qualification of data was necessary since Ru-106 was not detected in any of the samples.

### 6. DETECTION LIMITS AND SAMPLE RESULTS

All sample and LLD result calculations were verified using the formulae provided in the laboratory technical procedure and no discrepancies were identified with the exception of one non-detect result reported for sample B00FG4. The result has been corrected on the laboratory report form provided in Appendix A.

### 7. RADIOMETRIC AND GRAVIMETRIC YIELDS

Two blank spike samples were analyzed as part of this group of samples and the results were acceptable, however, since actual project samples were not spiked, the results may not be representative of the sample matrices.

### 8. DUPLICATE ANALYSES

Field duplicate samples were analyzed as part of this group and ruthenium-106 was not detected in either sample.

### 9. LABORATORY CONTROL SAMPLES

Laboratory control samples were not analyzed as part of this sample group, however no qualification is necessary since Ru-106 was not detected in any of the samples.

## 10. HOLDING TIMES

All samples were analyzed within 180 days of collection as required by the data validation procedures.

## 11. CONCLUSIONS

Sections 1 through 10 present a summary of the data quality for the subject data packages. The results contained in this report are acceptable for use. The appendices provide the laboratory result reports and supporting documentation. The original, as-received data package is being transmitted for submittal to the project QA record.

<sup>a</sup>It is assumed the density of water is 1.00 kg/L.

The less than values presented above are Lower Limits of Detection (LLD) values calculated for a 95% confidence interval as described in HASL-300. The reported errors were 2 sigma counting errors.

APPENDIX B  
SAMPLE RESULT VERIFICATION SPREADSHEETS

This appendix contains constituent result verification and recalculation spreadsheet printouts conducted using Lotus 1-2-3. The accuracy of the formulae used in the calculations have been verified using hand calculation methods and no discrepancies were noted. The formulae used for recalculation are provided in the attached PNL technical procedure, PNL-ALO-471.

## PNL TECHNICAL PROCEDURE

TITLE: PNL-ALO-471, DETERMINATION OF LOW CONCENTRATION OF  $^{106}\text{Ru}$  IN GROUND WATER BY DIRECT COUNTING ON DUAL LARGE SODIUM IODIDE DETECTORS WITH COINCIDENCE/ANTICOINCIDENCE MULTIDIMENSIONAL ANALYSIS

SCOPE

This procedure describes a method for measuring (or determining a lower limit of detection) extremely minute amounts of  $^{106}\text{Ru}$  in ground water by direct counting on large sodium-iodide coincidence/anticoincidence gamma-ray spectrometers. The sample volume should be at least 1.5 liters and can be as large as 4 liters provided appropriate standards are prepared and counted. A lower limit of detection (LLD) of 6 picoCuries per liter (pCi/L) of  $^{106}\text{Ru}$  (at 2 sigma) can be achieved in the presence of up to 500 pCi/L of  $^{60}\text{Co}$  concurrent with up to 100 pCi/L of  $^{214}\text{Bi}$  and a counting time of ~1 day. For samples containing no more than 50 pCi/L of  $^{60}\text{Co}$  along with 50 pCi/L of  $^{214}\text{Bi}$ , a LLD of 2 pCi/L of  $^{106}\text{Ru}$  can be achieved at the 95% level of confidence.

APPLICABILITY

This procedure is implemented to assure quality and is approved and written to conform with PNL-MA-70.

This procedure is applicable to the Counting Room Manager and trained and qualified personnel within the Analytical Chemistry Laboratory and Nuclear Chemistry Department of PNL.

This procedure is primarily intended to assure that the samples are counted on the gamma spectrometry equipment in the proper manner and that the data reduction is performed appropriately.

DEFINITIONS/ACRONYMS

- Laboratory Record Book - LRB
- Multidimensional Analysis (MDA) - a term referring to a gamma-ray system of analysis in which two large sodium-iodide crystals count single gamma-rays and coincidence gamma-rays. Counts from gamma-rays detected in only one of the detectors are stored in the corresponding x or y axis of the data storage array. Counts from

Author	Date	Project Mgr.	Date	RAD Representative	Date

Technical Reviewer	Date	Line Mgr.	Date	Other	Date
JH	7/26/91	[Signature]	8-15-91		
Procedure No.	Revision No.	Effective Date	Page	of	
PNL-ALO-471	0	AUG 15 1991	1		15

## PNL TECHNICAL PROCEDURE

gamma-rays detected in both detectors simultaneously are stored in the x and y portion of the data storage array. Photopeaks arising from events in one detector only are represented as areas on an x or y axis while photopeaks arising from events in both detectors simultaneously are represented as volumes in three dimensions (XYZ). In addition, large plastic scintillators which also detect gamma-rays surround these two detectors and are in anticoincidence (whenever a pulse from the plastic scintillator is detected, the counting system is gated off for a predetermined length of time).

- Lower Limit of Detection (LLD) - in total counts is defined as: The square root of two times the total counts of interference. System background and Compton from all contributing radionuclides are included in the interference. For purposes of this procedure,  $2\sigma$  confidence (i.e., two standard deviation) means that samples containing the amount of activity represented by the LLD will yield positive results 95% of the time (be categorized as above the LLD); and 5% of samples containing this amount of activity will be categorized as below the LLD. False positive results will occur for 2.50% of samples containing no  $^{106}\text{Ru}$ . The LLD in total counts can be converted into pCi/L by multiplying or dividing by all appropriate factors as described in the body of this text.
- Clean - a term that means free of radioactivity, at least free from smearable radioactivity.
- D/C Factor (disintegrations per count) - the inverse of counting efficiency which is in counts per disintegration.
- Decay Characteristics - decay characteristics of  $^{106}\text{Ru}$ ,  $^{106}\text{Rh}$ ,  $^{60}\text{Co}$ ,  $^{214}\text{Bi}$ , and other radionuclides can be found in Lederer and Shirley. For purposes of this procedure,  $^{106}\text{Ru}$  is the radionuclide referred to although  $^{106}\text{Rh}$  (daughter of  $^{106}\text{Ru}$ ) is the radionuclide actually emitting the gamma rays used to measure the activity. Since the half-life of  $^{106}\text{Ru}$  is long (372.6 days) and the half-life of  $^{106}\text{Rh}$  is short (29.8 seconds), secular equilibrium of  $^{106}\text{Ru}$ - $^{106}\text{Rh}$  is reached within a few minutes, i.e., the activity of  $^{106}\text{Rh}$  is "equal to" the activity of  $^{106}\text{Ru}$  within a few minutes after a sample containing  $^{106}\text{Ru}$  has been collected. In secular equilibrium, the half-life of  $^{106}\text{Ru}$  governs the decay of both radionuclides. The energies of the two coincident gamma rays used to measure  $^{106}\text{Ru}$  ( $^{106}\text{Rh}$ ) are 511.8 keV and 621.8 keV.
- Radon daughter(s) - Both  $^{222}\text{Rn}$  and  $^{220}\text{Rn}$  are found in the atmosphere from the decay of primordial uranium and thorium, respectively. The half-life of  $^{220}\text{Rn}$  is only 55.6 seconds and its activity (and the

Procedure No.	Revision No.	Effective Date	Page	of
PNL-ALO-471	0	AUG 15 1991	2	15

## PNL TECHNICAL PROCEDURE

activity of its daughters) found in a laboratory atmosphere is generally significantly less than that of  $^{222}\text{Rn}$  (and daughters) which has a 3.8235 day half-life. Bi-214 has a 19.8 minute half-life and is generally the major interference from atmospheric contamination.

PROCEDURE

## 1.0 Equipment and Materials

- A container in which the samples will be counted. The container should be of low density material such as plastic and should be about 11 inches to 12 inches in diameter and contain not less than 1.5 liters and not more than 4 liters. A Tupperware pie storage container is one acceptable container, and directions are given for this container. If some other container is used, then adjust the directions appropriately.
- Plastic bags (19" x 21" polyethylene are adequate) in which to place each sample to facilitate keeping the sample container free of radioactive contamination.
- Plastic tape (1" wide) or electricians tape (about .75" wide) or some other tape appropriate for taping the lid to the container.
- Impulse heat sealer to seal the plastic bags.
- Disposable plastic gloves, scissors, knife or scalpel, marking pens, writing pens (black ink), and a LRB should be available.
- One MDA counting system, with detectors of sufficient size to produce the desired results, and associated electronics. The system used for developing this procedure consist of two 12" diameter by 8" thick NaI(Tl) detectors with 4" thick sodium iodide (non Tl activated) "light pipes" which shield the detectors from primordial radioactivity in the photomultiplier tubes. These detectors are contained within a plastic scintillator anticoincidence shield which is 40" in diameter and 48" in length. Four inches of borated paraffin surrounds the plastic, and all is contained within a lead shield with 4" thick walls. High voltage supplies, amplifiers, ADC's, coincidence electronics, live timers, multichannel analyzer, printers, etc., comprise the operating MDA

Procedure No.	Revision No.	Effective Date	Page	of
PNL-ALO-471	0	AUG 13 1991	3	15

## PNL TECHNICAL PROCEDURE

systems. Data reduction is performed by computer using the appropriate data reduction program which has been verified by hand calculation.

## 2.0 Sample Preparation

If new containers are not used, the sample counting containers are prepared by thoroughly rinsing with deionized water, drying, and then sealing in individual plastic bags to keep them free of radioactive contamination.

A work station free of radioactive contamination is required. A clean bench (or clean paper or plastic placed on a bench) will suffice if reasonable care is taken. If the samples are radioactive, it may be necessary to determine the net weight of the samples while they are contained in a plastic bag. The following procedure keeps cross-contamination to a minimum. The average weight of an empty container, tape, and bag can be determined by individually taping, bagging, and weighing a few (3-5) empty containers. If the difference in weight is less than 10 grams, the average can be used for the tare weight for an entire set of containers (since 10 grams or less is an acceptable uncertainty for the weight or volume if the sample weight is 2000 grams or more). Typically, this uncertainty will be no more than one or two grams. Alternatively, a container can be tared, the sample added, and the sample weight read directly. In either case, the pertinent information shall be recorded in an LRB.

Specific gravity information will be supplied for each sample by the sampling organization and will be used to determine the volume based on the net weight of each sample. A specific gravity of 1.00 will be used if no specific gravity information is supplied.

Prepare a clean place to put each sample once it has been cleanly bagged. Remove each sample from its protective bag(s) in a manner that will not transfer contamination from one sample to another or to the clean section to which the sample is to be transferred. Transfer the sample into a clean polyethylene bag in such a manner that no contamination will be transferred to the outside of the clean bag. This can be accomplished if working alone by the following two steps.

Step 1: Ascertain that at least one hand is free of radioactivity i.e., "clean." Open the bag with a clean hand (disposable plastic gloves work well, and replacing gloves goes more quickly if two gloves are kept on each hand, replacing the outer one whenever it becomes potentially contaminated). Transfer the sample into the bag with the other hand (this other hand should be

Procedure No.	Revision No.	Effective Date	Page	of
PNL-ALO-471	0	AUG 15 1991	4	15

## PNL TECHNICAL PROCEDURE

relatively clean also, so as not to cross-contaminate the sample container). Considerable care must be taken to make sure the sample container does not touch any part of the outside of the clean bag into which it is being transferred.

Step 2: Seal the bag using an impulse sealer as close to the container as practical. This bag is the protection that the counting system has from contamination that may be on the sample container (and the system's protection in case some sample should accidentally leak from the sample container). Once the samples have been cleanly transferred into clean bags and sealed, place an additional bag around each sample to help keep radon and radon daughters from contaminating the inner bag. The outer bag is to be removed just prior to placing the sample into the counting chamber. Allow the samples to stay in the bag for 24 hours or more in order for radon daughters to have time to undergo significant decay. The samples are typically counted overnight (1000 to 1400 minutes). The count may consist of one long count or a series of short counts. The advantage of the shorter counts is that the possibility of gain shifting is reduced during the counting interval. The sample is again placed into a protective bag(s) upon removal from the counting chamber. This outer protective bag helps keep radioactive contamination from coming into contact with the inner (counting system protection) bag in case a recount is necessary.

### 3.0 Multidimensional Analysis (MDA) Spectrometry Procedure

Counting and data reduction including error analysis and LLD calculations are performed in the manner prescribed for gamma-ray spectrometry with sodium iodide detectors. For coincidence counting, the peaks are actually volumes, but since all algorithms are identical for areas or volumes, peak areas are used in this procedure. A brief general description follows.

#### 3.1 Energy Calibration

The gamma-ray spectrometer is calibrated for energy by adjusting the analyzer amplifier gain and ADC zero to achieve the desired peak locations. Cobalt-60 and  $^{137}\text{Cs}$  are typically used for this operation with the 661.7 keV peak from cesium being located in channel 14 and the peak from the sum of the 1173.2 keV and the 1332.5 keV gamma-rays of cobalt located mid-way between channels 50 and 52 (other radionuclides can be used if one well resolved photopeak below one MeV and one well resolved photopeak above two MeV are present in the spectrum).

Procedure No.	Revision No.	Effective Date	Page	of
PNL-ALO-471	0	AUG 15 1991	5	15

## PNL TECHNICAL PROCEDURE

Gain and/or zero shift during a count can radically change the number of counts in channels used to measure any particular radionuclide as well as the Compton contribution of any radionuclide to other areas. Gain and/or zero shift can sometimes be monitored by using the gamma-ray information obtained from counting the sample. Whenever this is not adequate, other radioactive sources must be placed into the counting chamber and used to ascertain that gain and zero are within acceptable limits. Gain and zero must be checked at sufficient intervals to ascertain that they are within acceptable limits. The Compton correction factors are derived by counting an aliquot of the appropriate radionuclide at a different time. It is necessary that gain and zero are set properly and are stable throughout a counting interval.

Acceptable limits can be established by counting appropriate radioactive sources at the correct gain and zero and counting them again with the gain and/or zero set slightly off and the efficiency and Compton factors compared to that obtained with correct settings. The gain and zero must be controlled such that they are acceptably close to the correct settings both before and after a sample is counted. If the temperature cannot be controlled to within a degree or two, extra caution should be used and measurements shall be made to assure that gain and/or zero are acceptably stable during a counting interval. If a computer controls data acquisition, then data can be transferred automatically periodically and the results combined algebraically. A bias error rather than a statistical error in the results may occur if gain or zero is consistently different during sample counting relative to what it was during standard counting.

- 3.2 Calibration Control Checks - counting a radioactive source that contains certain radionuclides periodically and determining that the results are consistent is referred to as "running controls" or "control checks". Controls shall include at least one coincidence gamma-emitting radionuclide and one or more single gamma-emitting radionuclide. Cobalt-60 and  $^{137}\text{Cs}$  can be used for control or other suitable radionuclides. It is not necessary that the control be a "standard" nor that it be in the same geometry as the samples being counted. It is necessary that the control be in a stable geometry and be counted in the same geometry each time. See PNL-ALO-470, Procedure for Maintaining Control of Germanium Spectrometers Used for Gamma-ray Spectroscopy. The information from at least one control check taken before the samples and standards are counted

Procedure No.	Revision No.	Effective Date	Page	of
PNL-ALO-471	0	AUG 15 1991	6	15

## PNL TECHNICAL PROCEDURE

and at least one control check taken after the samples and standards are counted shall be recorded.

### 3.3 System Background

A system background shall be determined. The background can be determined by counting a blank (as nearly identical as practical to that of the sample except that radioactivity is absent) for the same length of time as the sample. Alternatively, one or more backgrounds with counting intervals different, but longer than that used for the samples may be taken and the results adjusted for the difference in counting intervals according to standard practices.

### 3.4 Efficiency Calibration and Compton Interference Corrections

Radioactive standards shall be traceable to Nationally Recognized Standards (i.e., NIST or equivalent) and prepared as identical as possible to the samples in volume, shape, and medium. Counting efficiency in counts per disintegration is determined by counting a standard of known disintegration rate and then determining the number of net counts per disintegration. A standard of each radionuclide of interest (i.e.,  $^{106}\text{Ru}$ ) shall be prepared and counted either before, during, or after the period of time in which sample analyses are being performed. In addition, aliquots of  $^{60}\text{Co}$  and  $^{214}\text{Bi}$  in similar geometries shall be counted to determine the interference corrections. It is recommended that these standards and interference correction samples be counted before (or near) the beginning of the sample analysis period to avoid the need for recounting samples in the event of a system failure that cannot be repaired. The activity in the standards must not be so high that significant dead time or pulse pileup or any other problems occur due to the activity. The standards shall be counted for sufficient time so that 1 $\sigma$  statistical errors relevant to the peak counting efficiency and Compton areas are less than 2%.

Gross peak areas are determined by summing the counts in the channels selected for each radionuclide. The selection of channels is generally made after observing the spectra produced by counting the radionuclides of interest. Enough channels shall be used to represent more than half the total peak area. About 80% of the total peak area is generally sufficient to obtain the major portion of the peak area and not include too great an amount of interference. The channels used for determining the peak area for a standard shall be used for determining that peak area for each sample.

Procedure No.	Revision No.	Effective Date	Page	of
PNL-ALO-471	0	AUG 15 1991	7	15

## PNL TECHNICAL PROCEDURE

Net peak areas shall be determined in order to calculate the activity of each radionuclide they represent. Counts from the system background and counts from Compton produced by other radionuclides shall be subtracted from the gross peak areas to obtain the net peak area. For standards containing only one radionuclide, the only interference is system background.

Compton interference shall be quantified in order to make corrections. Compton correction factors are determined from the spectra of each standard by measuring the ratio of the net counts in the channels used to measure  $^{106}\text{Ru}$  to the net counts in the channels used to measure each radionuclide that is causing interference; and using this ratio to determine the counts in the channels for the sample by measuring the counts in the channels used to measure each interfering radionuclide and multiplying by the ratio determined from the appropriate standard. Compton correction factors can be determined for each radionuclide's effect on each of the areas used to measure all radionuclides observed in sample spectra.

When more than one radionuclide contributes to the Compton and if they are mutually interfering, an iterative process can be used to calculate the net counts for each interfering radionuclide and the net counts for  $^{106}\text{Ru}$  (or least squares matrix inversion, or any other appropriate method can be used).

Samples shall be positioned in the counting chamber in the same stable and reproducible geometry in which the standards are counted. The length of counting interval is mandated by the activity of radionuclides in each sample and the uncertainty or LLD that is desired. For samples with very low  $^{106}\text{Ru}$  activity such as is expected in ground water, total counting times of 1000 to 1400 minutes may be required (shorter counting times may produce acceptable LLD's for samples that have little interference). Data reduction is performed after the counting interval has ended.

### 3.5 Sample and Standards Counting

After verifying that the detector system to be used is in control by checking the "Detector Reliability Chart" (See PNL-ALO-470), the basic sample counting/data acquisition procedure is as follows:

#### 3.5.1 Position

Position the sample in the detector system using the appropriate sample holder for the required geometry.

Procedure No.	Revision No.	Effective Date	Page	of
PNL-ALO-471	0	AUG 15 1991	8	15

## PNL TECHNICAL PROCEDURE

### 3.5.2 Analyzer Start-Up

Clear the analyzer memory. Start the analyzer counting and record the date and time on a "Counting Sheet," or record directly into memory, if appropriate. A typical counting sheet is shown in Figure 1. Fill in known information on the counting sheet. Initial the sheet with the individual's initials who started the count, and sign the bottom of the sheet. The signature at the bottom is only required once for each Counting Sheet.

### 3.5.3 Analyzer Shutdown

Stop the multichannel analyzer from acquiring data. Record the elapsed time and initials of the Analyst changing the count on the count sheet. If the Analyst is different than in 3.5.2, the Analyst also signs at the bottom of the sheet. This signature at the bottom is only done once on each Counting Sheet.

### 3.5.4 Data Transfer and Storage

If the counting system is controlled by a PC, the data will be automatically transferred to a magnetic storage device when the system is stopped. If the counting system is a separate entity, transfer the spectral data from the analyzer to the data acquisition computer system, and store the data on a magnetic storage device (hard disk, floppy disk, etc.). If the sample and counting parameters are not transferred, they will be added via keyboard from the counting sheet.

### 3.5.5 Data Identification

The following parameters shall accompany the spectral data, on a hard copy printout from a printer or in the associated file stored on a magnetic storage device:

- a. Identification (sample description with a unique id).
- b. Computer file name (if on computer) unique to the particular sample.
- c. Start time of the count.

Procedure No.	Revision No.	Effective Date	Page	of
PNL-ALO-471	0	AUG 15 1991	9	15

9613477-1927

PNL TECHNICAL PROCEDURE

- d. Date and time of sample collection.
- e. Live time of count (actual time the MCA is free to accept pulses). This should be determined by the MCA and transferred within the spectra.
- f. Real time of count (the actual duration of count in regular clock time).
- g. Sample mass and/or volume.

3.5.6 Data Analysis

Use a gamma-ray data reduction program to analyze the individual spectra and calculate the final concentration values. The calculated values may be verified by hand calculations, if necessary. The program used is "MDA" for multidimensional analysis.

4.0 Calculations

4.1 The calculational Methodology used to calculate activity in pCi per liter is illustrated below.

$$\text{Activity} = \frac{(\text{gross counts} - \text{background counts} - \text{Compton counts}) \times \text{D/C factor} \times \text{decay correction}}{\text{length of count in minutes} \times \text{volume in liters} \times 2.22}$$

Where: 2.22 = disintegrations per minute per pCi

D/C factor = 1 divided by the counting efficiency in counts per disintegration

$$\text{Decay correction} = e^{-\lambda t}$$

where  $\lambda$  = the natural log of 2 divided by the half-life in minutes (may be called decay constant)

t = minutes from mid point of sampling to mid point of count (this is an approximation but is quite accurate where sampling and counting times are short relative to the half-life).

Example for calculation of activity:

volume of sample = 3.500 liters

length of count = 1038 minutes

decay time from mid point of sample collection to mid point of count = 5040 minutes.

Gross counts in <sup>106</sup>Ru channels = 3980 system background = 291

Procedure No. PNL-ALO-471	Revision No. 0	Effective Date AUG 15 1991 <sub>1</sub>	Page 10	of 15
------------------------------	-------------------	--	------------	----------

## PNL TECHNICAL PROCEDURE

Gross counts in  $^{60}\text{Co}$  channels = 103856 system background = 41

Gross counts in  $^{214}\text{Bi}$  channels = 31927 system background = 1023

Subtract the appropriate system background from each gross

counts left in  $^{106}\text{Ru}$  channels = 3689  
 counts left in  $^{60}\text{Co}$  channels = 103815  
 counts left in  $^{214}\text{Bi}$  channels = 30904  
 Compton factor  $^{106}\text{Ru}$  effect on  $^{60}\text{Co}$  = 0.00131  
 Compton factor  $^{106}\text{Ru}$  effect on  $^{214}\text{Bi}$  = 0.04770  
 Compton factor  $^{60}\text{Co}$  effect on  $^{106}\text{Ru}$  = 0.02134  
 Compton factor  $^{60}\text{Co}$  effect on  $^{214}\text{Bi}$  = 0.2257  
 Compton factor  $^{214}\text{Bi}$  effect on  $^{60}\text{Co}$  = 0.00987  
 Compton factor  $^{214}\text{Bi}$  effect on  $^{106}\text{Ru}$  = 0.2022

Compton correction factors are applied to the value for "counts left after background subtraction" until a net or temporary net has been determined for each radionuclide. Note that the temporary net values should be used in the equations at the first opportunity. The "counts left after subtracting background" is the value from which to subtract the Compton counts.

$$\text{Temporary Net } ^{214}\text{Bi} = 30904 - (3689 \times .04770) - (103815 \times .22570) = 7297.$$

$$\text{Temporary Net } ^{60}\text{Co} = 103815 - (7297 \times .00987) - (3689 \times .00131) = 103738.$$

$$\text{Temporary Net } ^{106}\text{Ru} = 3689 - (7297 \times .20220) - (103738 \times .02134) = -.222$$

Retain the new values for each of the radionuclides and repeat the exercise, i.e.:

$$\text{Temporary Net } ^{214}\text{Bi} = 30904 - (-.222 \times .04770) - (103738 \times .22570) = 7490.$$

$$\text{Temporary Net } ^{60}\text{Co} = 103815 - (7490 \times .00987) - (-.222 \times .00131) = 103741.$$

$$\text{Temporary Net } ^{106}\text{Ru} = 3689 - (7490 \times .20220) - (103741 \times .02134) = -39.3$$

Retain the new values for each of the radionuclides and repeat once more, i.e.:

$$\text{Net } ^{214}\text{Bi} = 30904 - (-39.3 \times .04770) - (103741 \times .22570) = 7492.$$

$$\text{Net } ^{60}\text{Co} = 103815 - (7492 \times .00987) - (-39.3 \times .00131) = 103741.$$

$$\text{Net } ^{106}\text{Ru} = 3689 - (7492 \times .20220) - (103741 \times .02134) = -39.7$$

Three or more iterations will be performed. Using these net values and the appropriate Compton factors, the Compton interference can be calculated as follows:

$$^{214}\text{Bi Compton} = 7492. \times .20220 = 1515.$$

$$^{60}\text{Co Compton} = 103741. \times .02134 = 2214.$$

$$\text{Total Compton interference} = 1515 + 2214 = 3729.$$

PNL TECHNICAL PROCEDURE

The values necessary for calculations have now been determined, and the activity of <sup>106</sup>Ru in pCi/L can be determined:

- Gross counts (<sup>106</sup>Ru) = 3980
- System background counts = 291
- Compton interference = 3729
- Net counts = 3980 - 291 - 3729 = -40.
- D/C factor = 220
- Length of count (min) = 1038
- Volume (in liters) = 3.5
- Decay time (min) = 5040
- Decay constant =  $1.293 \times 10^6 \text{ minute}^{-1}$
- Decay correction =  $e^{-\lambda t} = e^{-(1.293 \times 10^6 \text{ minute}^{-1}) (5040 \text{ minutes})}$

$$\text{Activity} = \frac{(\text{gross counts} - \text{background counts} - \text{Compton counts}) \times \text{D/C factor} \times \text{decay correction}}{\text{length of count in minutes} \times \text{volume in liters} \times 2.22}$$

$$\text{Activity} = \frac{(3980. - 291. - 3729.) \times 220. \times 1.0065}{1038. \times 3.500 \times 2.22}$$

Activity = - 1.10 pCi/L of <sup>106</sup>Ru of sample

4.2 The uncertainty is calculated as follows:

Uncertainty (in total counts) = the square root of (gross counts plus interference)  
 = the square root of (3980. + 291. + 3729.) = 89.44

Uncertainty (in pCi/L) is determined by multiplying or dividing the value in total counts by the appropriate factors as in the example for determination of activity listed above. This uncertainty is at 1σ confidence (68%); simply multiply by two to get 2σ confidence.

The uncertainty (in pCi/L) for this example is:

$$\text{Uncertainty} = \frac{(\text{Uncertainty in total counts}) \times \text{D/C factor} \times \text{decay correction}}{\text{length of count in minutes} \times \text{volume in liters} \times 2.22}$$

$$\text{Uncertainty} = \frac{89.7 \times 220. \times 1.0065}{1038. \times 3.500 \times 2.22} = 2.46 \text{ pCi/L of } ^{106}\text{Ru at } 1 \sigma$$

4.3 The LLD for <sup>106</sup>Ru in the sample used for the example shown above is calculated as follows:

The LLD for <sup>106</sup>Ru (in total counts) is:

LLD = the square root of (two times (total counts in system background + total counts Compton))

= the square root of 2(291. + 3729.) = 89.67, this value is in total counts

= this value in total counts can be converted into picocuries per liter by multiplying or dividing by all the factors used to calculate the activity in the example above.

$$\text{LLD} = \frac{89.7 \times 220. \times 1.0065}{1038. \times 3.500 \times 2.22}$$

Procedure No. PNL-ALO-471	Revision No. 0	Effective Date AUG 15 1991	Page 12	of 15
------------------------------	-------------------	-------------------------------	------------	----------

iiiik

## PNL TECHNICAL PROCEDURE

LLD = 2.46 pCi/L of  $^{106}\text{Ru}$  of sample ( $1\sigma$ )

If the sample and the system background are counted for different lengths of time, then a correction must be made for that difference in activity calculations, uncertainty calculations, and LLD determinations (see ASTM standards). Equations can be worked out to handle whatever method is chosen and data reduction by computer can be utilized.

### 5.0 Sample Storage and Disposal

The samples shall be returned to WHC for disposal. These samples are rather large and will take up significant space in the counting laboratory and the number of samples in the counting laboratory should be minimized.

### 6.0 Potential Interference and Recommended Precautions

If significant quantities of other interfering radionuclides are present, the LLD will increase. Likewise, if  $^{60}\text{Co}$  and/or  $^{214}\text{Bi}$  are present in larger quantities, the LLD will be higher.

Measurements may be made on samples having activity as high as a few microcuries of  $^{106}\text{Ru}$  (per sample) provided the total activity of all radionuclides in the sample is no more than a few microcuries. If samples with higher activity are counted, care should be used to ascertain that pulse pileup or some other electronic malady does not cause erroneous results to be obtained.

The major interferences in the samples measured during development of this procedure were  $^{60}\text{Co}$  and  $^{214}\text{Bi}$ . Radon (and effectively, its short half-life daughters) can generally be removed by sparging with argon or helium if necessary to meet detection limit requirements, but the improvement would be rather small for these samples since cobalt is the larger contributor. If the counting can be performed about two weeks or longer after sampling, radon daughter interference will be reduced through radioactive decay and escape of the gaseous radon. For wells with low  $^{60}\text{Co}$  activity, radon daughters become the major interference but are typically low enough to allow detection limits of 3 pCi of  $^{106}\text{Ru}$  per liter to be achieved (even at the  $2\sigma$  confidence level). Potassium-40 (if present) will contribute slightly to the ruthenium peak. The potassium peak area should be monitored and a correction made if necessary.

Radon daughter contamination from radon and daughters in the atmosphere should be controlled by keeping the samples in at least one extra

PNL TECHNICAL PROCEDURE

plastic bag while they are awaiting counting and removing it immediately before placing the sample into the counting chamber. If a sample must be counted soon after it has been taken or prepared for counting (i.e., soon after it has been placed into the primary plastic bag that is required before placing the sample into the counting chamber), a 2-hour period should elapse before starting the count to allow time for short half-life radon daughters to decay by about an order of magnitude. These radionuclides deposited on the outside of the sample container may produce a different Compton spectrum than that from the solution located inside the container and lead to erroneous results.

Continual vigilance for any other radionuclides that might contribute to the ruthenium peak area is always recommended. It goes without saying that the instrumentation must be maintained in good, reliable working condition and the system maintained free of contamination (especially <sup>106</sup>Ru).

The system background may vary slightly due to various primary and secondary effects from cosmic radiation. This should not be significant at the level of activity in these samples if the electronics are maintained properly. The background due to radon daughters is another matter and could be significant if not kept under control. Again, a bias may occur if some consistent pattern is inadvertently developed.

7.0 Specific Qualifications

This procedure utilizes radiochemical standards for control, and as such meets the definition to be self-qualifying per PNL-MA-70, PAP-70-901.

8.0 Records

Records shall be maintained and controlled so as to conform to requirements of PNL-MA-70, PAP-70-1701. Laboratory Record Books and Data Sheets provide a mechanism for control of most records. Laboratory Record Books will be used in accordance with Act Now Directive 89-1.

APPENDIX C  
DATA VALIDATION DOCUMENTATION

9513177.2934

### RADIOCHEMISTRY DATA VALIDATION CHECKLIST

Data Package ID: B00F01 Laboratory: PNL

Data Validator: K. Amalos Date: 9/28/92

Analysis/Sample Identification/Matrix: Ra-226 / B00F01, B00F11, B00FF7, B00FB3, B00F93, B00FR0, B00FS4, B00F00, B00F90, B00FB6, B00FC4, B00FG4 / water

#### 1. Completeness

1.1 Completeness Checklist (Complete the appropriate checklist for each analysis type and attach).

#### 2. Calibration

##### 2.1 Initial Calibration

Was instrument calibrated within specified time period or annually? (Y/N/NA) Y 3/18/91

If NO, qualify all associated data as unusable (R).

Was each detector used for the associated data calibrated? (Y/N/NA) Y

If NO, qualify all associated data as unusable (R).

Are calibration standards NIST traceable or equivalent? (Y/N/NA) Y

If NO, qualify all associated data as unusable (R).

Were calibration standards expired? (Y/N/NA) N

If YES, qualify all associated data as unusable (R).

Comments/Qualified Results: Detector initials were analyzed on 3/18/91

2.2 Continuing Calibration

Is check source identified by activity and radionuclides? (Y/N/NA) Y

If NO, qualify all associated data as estimated (J).

Has check source been counted daily? (Y/N/NA) N, but counts were run at least 3-4 times weekly

If NO, qualify all associated data as unusable (R).

Are check source counts within  $\pm 3S$  control limits? (Y/N/NA) Y Note 1

If NO, qualify all associated data as unusable (R).

Have background counts been performed at least weekly and before and after all field and QC samples associated with the SDG? (Y/N/NA) Y Note 2.

If NO, qualify all associated results as unusable (R).

Are background counts within  $\pm 3S$  control limits? (Y/N/NA) NA

If NO, qualify all associated results as unusable (R).

Comments/Qualified Results: \_\_\_\_\_

1. One check source analyzed after samples were complete close but still the limits.

2. Background checks run with each sample.

Multiple horizontal lines for additional notes or data entry.

3. Blanks

Have reagent/method/field blanks been analyzed with the SDG? (Y/N/NA) NO

If NO, qualify all results >LLD as estimated (J).

Are positive results reported in the reagent/method/field blanks? (Y/N/NA) NA

If YES, qualify positive results less than the MDA as nondetects (U). Qualify sample results <10X the blank value but greater than the MDA as estimated (J).

Can blank results be verified/calculated properly? (Y/N/NA): NA

Comments/Notes/Qualified Results:

No method blanks analyzed all results qualified as J for detect.

4. Detection Limits and Sample Results

Can LLDs and MDAs be verified? (Y/N/NA) N ①

If NO, qualify all results as estimated detects (J) or estimated nondetects (UJ).

Do reported results meet the detection limit requirements? (Y/N/NA) Y ②

Note discrepancies in the validation report narrative under representativeness.

Can reported results be verified? (Y/N/NA) Y

If NO, note missing data in the validation report. Correct results on the photocopied report forms and include in the validation report.

Comments/Notes/Qualified Results:

① LLD's not determined using formulae in validation procedure.

② Most results reported to be required of Sp.C.L.

6. Duplicate Samples and Analyses

Has at least one duplicate analysis been performed for every 10 samples in the SDG? (Y/N/NA) Y Field Duplicates

If NO, qualify all associated results as estimated (J).

Has the field blank been used for duplicate or MS/MSD analysis? (Y/N/NA) N

Are RPD values  $\leq 35\%$  for results  $> 5X$  the LLD and within  $\pm 2X$  the LLD for results  $< 5X$  the LLD? (Y/N/NA) Y

If NO, qualify associated results  $< LLD$  as estimated nondetects (U) and all associated results  $> LLD$  as estimated detects (J).

Comments/Notes/Qualified Results: \_\_\_\_\_

Sample ID	1307FL4	1307F64	92RPD
FWL ID	91-2860	91-2962	

No 106	21.6	22.4	---
--------	------	------	-----

8. Holding Times

Have all samples/analyses been completed within 5 half-lives or 180 days, whichever comes first? (Y/N/NA): Y

If NO, qualify all associated results >LLD as estimated detects (J) and all associated results <LLD as estimated non-detects (UJ). For gross exceedances (>2X criteria) qualify all associated results as unusable (R).

Comments/Notes/Qualified Results: All samples analyzed within 180 days.

9.2 Alpha Spectroscopy

Has detector system been calibrated across the energy range of interest? (Y/N/NA): \_\_\_\_\_

If NO, qualify all results as unusable (R).

Is detector resolution adequate to identify each peak centroid? (Y/N/NA): \_\_\_\_\_

If NO or if resolution cannot be determined, qualify all results as unusable (R).

Is resolution at least 20 keV FWHM? (Y/N/NA): \_\_\_\_\_

If NO, qualify all results as estimated (J).

Do check source efficiencies agree within 5% of initial calibration efficiencies or are they within the control limits or  $\pm 3S$  of the mean? (Y/N/NA): \_\_\_\_\_

If NO, qualify all associated results as unusable (R).

Was each sample spiked with a tracer? (Y/N/NA): \_\_\_\_\_

If NO, qualify all associated results as unusable (R).

Are tracer recoveries within the control limits of 30 to 105%? (Y/N/NA): \_\_\_\_\_

If NO, qualify all results as follows:

%R:                      <30%   30-105%   >105%   >115%

Results <LLD:        R        acceptable   UJ        R

Results >LLD:        R        acceptable   J         R

9.3 Gamma Spectroscopy

Does efficiency calibration approximate a smooth semi-log curve? (Y/N/NA): NA<sup>(2)</sup>

If NO, qualify all results as unusable (R).

Have geometry or matrix factors been accounted for in all analyses? (Y/N/NA): Y

If NO, qualify all associated results as unusable (R).

Does the detector calibration cover the energy range of interest and at least 0 to 2 MeV? (Y/N/NA): Y<sup>(1)</sup>

If NO, qualify all results outside the energy range as unusable (R).

Is resolution of the detector system adequate and less than 5 FWHM? (Y/N/NA): NA<sup>(2)</sup>

If NO, qualify all results as estimated (J).

Comments/Notes/Qualified Results: \_\_\_\_\_

*① Detector was calibrated using an Amersham Ru-106 standard.*

*② Analysis was run on a multidimensional NaI detector.*

9.4 Alpha Emitting Radium Isotopes

Have single radium isotopes (Ra-223, Ra-224, Ra-226) been reported? (Y/N/NA): \_\_\_\_\_

If YES, qualify all results attributed to a single radium isotope as estimated (J) if the contribution to the total from individual isotopes is unknown.

Can time from sample precipitation to counting be verified? (Y/N/NA): \_\_\_\_\_

If NO, qualify all associated results >MDA as estimated (J).

Have barium interferences been identified and accounted for? (Y/N/NA): \_\_\_\_\_

If NO, qualify all associated results with elevated barium levels as estimated (J).

Has counting efficiency for Ra-226 been determined for each SDG? (Y/N/NA): \_\_\_\_\_

If NO, qualify all associated results as unusable (R).

Have blanks been analyzed with each group to check for possible radium contamination in the reagents? (Y/N/NA): \_\_\_\_\_

If NO, qualify all associated results as estimated (J).

Are LCS recoveries with the control limits listed below? (Y/N/NA): \_\_\_\_\_

If no, qualify sample results as follows:

%R: \_\_\_\_\_ <50% 50-69% 70-130% >130%

Results <MDA R UJ Acceptable R

Results >MDA R J Acceptable R

If sample was preserved at collection has analysis been completed within 180 days or 5 half-lives? (Y/N/NA): \_\_\_\_\_

If NO, qualify results >LLD as estimated detects (J) and results < LLD as estimated non-detects (UJ).

If samples were not preserved, were samples received within 5 days of sampling? (Y/N/NA): \_\_\_\_\_

• Were samples preserved at the laboratory upon receipt? (Y/N/NA): \_\_\_\_\_

• Were samples held after preservation for at least 16 days? (Y/N/NA): \_\_\_\_\_

If NO, to any of the above, qualify associated sample results as estimated (J).

Comments/Notes/Qualified Results: \_\_\_\_\_

9.5 Radium 226 Analysis using Scintillation (Lucas) Cell Counting

Is calibration data present and can it be associated with the samples? (Y/N/NA): \_\_\_\_\_

If NO, qualify associated sample results as unusable (R).

Was the counting system calibrated each day that samples were analyzed? (Y/N/NA): \_\_\_\_\_

If NO, qualify associated results as estimated (J).

Was the counting system calibrated after replacing the scintillation cell? (Y/N/NA): \_\_\_\_\_

If NO, qualify associated results as estimated (J) if the cell has a previously determined calibration constant and unusable (R) if no constant is available for the replacement cell.

Were blanks analyzed with each sample group to check for radium contamination in reagents? (Y/N/NA): \_\_\_\_\_

If NO, qualify associated results as estimated (J).

If sample was preserved at collection has analysis been completed within 180 days or 5 half-lives? (Y/N/NA): \_\_\_\_\_

If NO, qualify results >LLD as estimated detects (J) and results < LLD as estimated non-detects (UJ).

If samples were not preserved, were samples received within 5 days of sampling? (Y/N/NA): \_\_\_\_\_

• Were samples preserved at the laboratory upon receipt? (Y/N/NA): \_\_\_\_\_

• Were samples held after preservation for at least 16 days? (Y/N/NA): \_\_\_\_\_

If NO, to any of the above, qualify associated sample results as estimated (J).

Comments/Notes/Qualified Results: \_\_\_\_\_

1. Concentration of stock ICV-6 = 9.4 mg/L (9.4 ug of cyanide is added to each distillation flask and recovered in 250 mL of NaOH).
2. Concentration of spike added = 90.6 ug/L.
3. Contract required detection limit for water = 10 ug/L.
4. Used 250 mL of sample per distillation for sample G1, G2 and G3 due to limited sample size of 1.5L of total sample.
5. Duplicate precision under the CLP protocol must be within one CRDL when either sample or duplicate are below 5X CRDL.

CLP "C" FLAGS

U = Analyzed but not detected (IDL or less than IDL)  
B = Less than CRDL but greater than or equal to IDL.

CLP "Q" FLAGS

N = Spiked sample recovery not within control limits  
\* = duplicate analysis not within control limits
