12. Description of Change 1. The excavation in lifts will stop when the detector cart has met performance levels. If necessary, the bentonite from the vadose boring will be removed to remove traces of contamination. One of the six full suite samples (gamma, TAL metals, anions, total activity) will be taken at the bottom of the excavated area. In addition to removing the bentonite, up to three test pits may be taken to examine the soil for migrating contamination. Total activity and/or gamma energy analysis will be used to verify the lack of contamination in these test pits. Full suite verification of the bottom/slope of the excavation will be conducted as described in the test procedures. Only one of the full suite samples will include VOA and Semi-VOA analysis. 2. The testing of the surfactants (as described in Appendix B) will not continue unless the wind speed increases and the moisture content of the soil decreases enough to allow dust to become windborn.

		Facilitate Const. <input type="checkbox"/>	Const. Error/Omission <input type="checkbox"/>	Design Error/Omission <input type="checkbox"/>	
13b. Justification Details 1. Additional excavation is unnecessary if performance levels have been met. The procedures assumed contamination to a depth of 25 ft. and did not discuss the option of meeting the performance levels prior to reaching 25 ft. Test pits will be dug to examine lateral extent of the excavation. 2. Tests conducted to date are inconclusive. Additional tests will not provide useful information unless weather and soil conditions change. To date, very little water has been used to control dust and comparisons on this limited scope will not be valid.
