Waste Site Reclassification Form

Date Submitted: 10/21/1998	Operable Unit(s): 300-FF-2	Control Number: 98-143
Originator: Brian Dixon, G3-26	Waste Site ID: 300-183	
Phone: (509) 376-7053	Type of Reclassification Action:	
	Rejected <input checked="" type="radio"/> Closed-Out <input type="radio"/> No Action <input type="radio"/>	

This form documents agreement among the parties listed below authorizing classification of the subject unit as rejected, closed-out, or no action and authorizing backfill of the site, if appropriate. Final removal from the NPL of no action or closed-out sites will occur at a future date.

Description of current waste site condition:

The site is a french drain that received steam condensate. The drain is a clay pipe with an outer diameter of 0.89 meters (2.92 feet) and is covered by a metal lid. The top of the clay pipe is approximately 14 centimeters (5.5 inches) above grade. During the site walkdown, the site was surrounded by a metal safety barricade. It was also observed that the lid has some sort of white buildup that can be dislodged. The drain was not labeled "F.D. #40" as described in the "Inventory of Miscellaneous Streams," Revision 3. The site is surrounded by asphalt. It appears as though a section of asphalt between the site and the 3718 Building has been excavated. Four metal pipes extend from the south wall of the 3718 Building near the site. Two of these pipes, which are approximately 10 centimeters and 12 centimeters in diameter, exit the building within 1 meter (3.3 feet) of the ground surface make a 90 degree and disappear into the asphalt. The other two pipes exit the building approximately 10 feet above the ground surface. One makes a 90 degree turn towards the roof and the other makes a 90 degree turn towards the ground. Both appear to terminate open-ended. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The site is listed in the "Inventory of Miscellaneous Streams," Revision 3, as stream #340.

Basis for reclassification:

The "Inventory of Miscellaneous Streams," Revision 3, lists the site as inactive, source abandoned. This stream was "Eliminated" in 6/98; the steam source has been shut off. When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute). This site received steam condensate only. Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.
