Interim stabilization, decontamination, cribs, settling tank, septic tank, drain field APPROVED FOR PUBLIC RELEASE KMB 7/9/92	Name: D. L. Smith D. L. Smith 7-9-92 Signature Organization/Charge Code 81490/PJ44J

7. Abstract

This report documents the task and activities necessary to interim stabilize 216-U-1 and 216-U-2 cribs. Interim stabilization was necessary to maintain the site in a stable configuration until closure activities have been determined and initiated. Site size is approximately 3 acres.

8. PURPOSE AND USE OF DOCUMENT - This document was prepared for use within the U.S. Department of Energy and its contractors. It is to be used only to perform, direct, or integrate work under U.S. Department of Energy contracts. This document is not approved for public release until reviewed.

PATENT STATUS - This document copy, since it is transmitted in advance of patent clearance, is made available in confidence solely for use in performance of work under contracts with the U.S. Department of Energy. This document is not to be published nor its contents otherwise disseminated or used for purposes other than specified above before patent approval for such release or use has been secured, upon request, from the Patent Counsel, U.S. Department of Energy Field Office, Richland, WA.

Legends removed per request of Legal KMB 7/9/92

DISCLAIMER - This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government nor any agency thereof, nor any of their employees, nor any of their contractors, subcontractors or their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or any third party's use or the results of such use of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise, does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof or its contractors or subcontractors. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or any agency thereof.

operated in the cave-in zones above the cribs without incident. No special precautions were taken as the equipment was never entirely in the cave-in zone. This was possible due to the large equipment and small cave-in potential area.

4.2.5. Zone 5

Zone 5 is the area above and immediately adjacent to the 241-U-361 settling tank. Readings of 2,000 to 6,000 dpm beta/gamma were present. This area was stabilized with shot-crete and trifluralin-impregnated fabric. Because the area surrounding the tank (Zone 3) was stabilized, wooden forms were built around the perimeter of the area to be shot-creted. This was to keep the area where shot-crete was to be applied free from surrounding clean fill. The biobarrier was placed within the confines of the forms. Plastic sheeting was fastened around each of the risers. This kept the risers free of shot-crete so that future sampling of the tank would not be hindered. Shot-crete was applied to a depth of 4 inches. After the shot-crete had cured, the forms were removed. The clean fill was then pushed out over the edge of the shot-crete. The surrounding soil was formed into a berm, and sloped away from the shot-crete. This will prevent run-off from accumulating over the settling tank. The area was posted as underground radioactive material.

4.3. POST STABILIZATION

Interim stabilization was completed in December 1991. This late finish date did not allow for revegetation to occur. Straw mulch was broadcast over the site and crimped. This should reduce the amount of soil erosion due to wind. Revegetation is planned for the fall of 1992.

Areas that were successfully decontaminated were released from radiological posting requirements. This includes the majority of Zone 1 and a portion of Zone 2. The remainder of the site was downposted to underground radioactive material. See Appendix A for the coordinates of the underground radioactive marker post.

Photographs (Figure 6) and civil surveys (Figure 7) were conducted to record site characteristics after interim stabilization had occurred.

The 216-U-1 and 216-U-2 cribs and surrounding areas will receive routine surveillance and maintenance. This will include monitoring for surface radioactive material, the presence of deep-rooted vegetation, subsurface intrusion by animals or insects, proper posting, and general appearance and condition. In addition, the site will receive applications of selective herbicide and be cleaned of unwanted vegetation.

9312270250

7.4. SITE CHARACTERIZATION

More complete radiological surveys are required prior to initiating earth moving. This information would allow for better planning, and less scope change once the job begins. It is recommended that numerous test holes be excavated down to 12 inches and surveyed carefully for radioactive contamination. This information is crucial in determining if decontamination is feasible.

7.5. HEAVY EQUIPMENT WORK OVER UNDERGROUND PIPELINES

The 2607-W5 drain field was identified by Steam and Water Utilities as being susceptible to damage from interim stabilization activities. With careful planning, it was possible to work in the drain field without causing any damage.

A 20-inch and two 12-inch water lines were also identified by Steam and Water Utilities as being suspectable to damage from interim stabilization activities. A grader with its blade extended to one side was used to decontaminate the surface above the pipe. This prevented heavy equipment from having to operate directly on top of the pipelines, and allowed successful decontamination.

9312270105

8. EXPECTATIONS

It is expected that the soil cover and vegetation will provide an adequate barrier to the radioactive contamination. This technique has proven successful on many other sites.

Since this is the first time shot-crete and trifluralin-impregnated fabric has been used on a Radiation Area Remedial Action (RARA) site, it is not entirely known how this technique will perform. It is expected to provide an adequate barrier to the radioactive contamination. The cover will crack due to freeze/thaw cycles. These cracks will most likely fill with dust. This dust may support plant life, however the roots should not penetrate the biobarrier. Until an adequate vegetation layer is established in the area surrounding the shot-crete, periodic removal of weeds and blown sand may be required.

9. TIMELINE

Interim stabilization began with site preparation in early November 1991 and ended in mid-December 1991 with reposting of the site.
